COMMITTEE MEMBERS PRESENT

James D. Boyd, Commissioner, IEPR Committee

Co-Chairman

William J. Keese, Commissioner, IEPR Committee

Co-Chairman

John L. Geesman, Commissioner, Renewables

Committee Chairman

STAFF PRESENT

Melissa Jones, Advisor to Commissioner Geesman

Timothy Tutt, Renewable Energy Program

Drake S. Johnson, Power Source Disclosure Program

Pamela Doughman, Renewable Energy Program

George Simons, PIER Renewables Program

Karen Griffin, Integrated Energy Policy Report

Manager

Pierre duVair, Climate Change Program

ALSO PRESENT

Mark J. Skowronski, Solargenix Energy

Thomas Tanton, T2 & Associates

Paul Brophy, EGS, Inc.

Harold M. Romanowitz, Oak Creek Energy Systems

Susan Petty, Black Mountain Technology

Nancy Rader, CalWEA

Robert B. Liden, SES

A P P E A R A N C E S, continued

ALSO PRESENT, continued

Steven Kelly, IEP

Thomas O'Connor, representing Solargenix

Jane Hughes Turnbull, Peninsula Energy Partners

Brian Schumacher, Public Utilities Commission

Jack Pigott, Calpine

Joseph Kloberdanz, Southern California Edison

Hal Verdon, Novi Industries, Inc.

Gregg Morris, Green Power Institute

Lyn Harris Hicks

Antonio Velarde, Southern California Edison

Chifong Thomas, Pacific Gas and Electric

Dave Konwinski, Onsite Power Systems, Inc.

Gary L. Allen, Southern California Edison

Johan Galleberg, California ISO

Doug Wickizer, CA Department of Forestry and Fire
Protection

Matt Summers, CA Department of Food and
Agriculture

Doug Grandy, CA Department of General Services

Discussion, Questions and Comments	191
Closing Comments	206
Adjournment	207
Reporter's Certificate	208

P R O C E E D I N G S

CHAIRMAN BOYD: Well, good morning ladies and gentleman. Welcome to the somewhat unique Joint Integrated Energy Policy Report and Renewables Committee Workshop.

I'm Jim Boyd, Commissioner and Chairman of the Integrated Energy Policy Report committee. With me today are Chairman Keese, who is the second member of that Committee, and Commissioner Geesman, who is the Chair of the Renewables Committee.

In a moment I'll throw the mike to them for any opening comments, but let me give everybody a little background on this, and then I will turn the meeting over, after we're done, to Tim Tutt, who's going to be our Moderator today. With Commissioner Geesman is his Advisor, Melissa Jones, and Mike Smith is --he's not out in the audience so --.

In any event, this workshop supports the preparation by this Commission of the 2003 Integrated Energy Policy Report, which Senate Bill 1389, by Senator Boan, last year required the Energy Commission to adopt an Integrated Energy Policy Report every two years with the first

1 report due to the California Legislature November
2 1st of this year.

3 This policy report will be supported by
4 three subordinate reports -- the Electricity and
5 Natural Gas Assessment, the Transportation Fuel
6 Technologies and Infrastructure Assessment, and
7 the Public Interest Energy Strategies Assessment.

8 The subject matter of this workshop
9 today relates to the Public Interest Energy
10 Strategy's Assessment component of the overall
11 Report. Senate Bill 1038, by Senator Sher in
12 2002, requires the Energy Commission to submit to
13 the legislature by December 1st of this year a
14 comprehensive renewable electricity generation
15 resource plan, a plan that is referred to as the
16 Renewable Resource Development Report.

17 It describes the renewable resource
18 potential available in California, along with a
19 plan to achieve the target of increasing the
20 annual amount of electricity generated from
21 renewable resources to equal 17 percent of the
22 total electricity for consumption in California by
23 2006.

24 The Renewable Portfolio Standard -- or
25 RPS as we refer to it -- target was modified to 20

1 percent by 2017 by Senate Bill 1078. And the
2 report will be a technical appendix to the Public
3 Interest Energy Strategies Assessment that the
4 Commission is at present working on.

5 Senate Bill 1038 also requires the
6 CPUC -- the Public Utilities Commission -- to
7 complete a transmission plan and submit it to the
8 legislature by December 1st of this year. The PUC
9 is directed to use the Renewable Resource
10 Development Report, which will not be completed
11 until December, in preparing its transmission
12 plan.

13 So we have a tough task of coordination
14 here, to facilitate the coordination of these
15 tasks. The Energy Commission has agreed to
16 prepare a preliminary renewable resource
17 assessment for 2005 through 2008, and deliver it
18 the PUC on July 1st of this year.

19 The Integrated Energy Policy Report
20 Committee and the Renewables Committee will use
21 information from this workshop, along with input
22 from staff and technical consultants, to revise
23 the preliminary Renewable Resource Assessment,
24 prepare the Renewable Resource Development Report,
25 and prepare the renewable energy portion of the

1 Public Interest Energy Strategies assessment.

2 Copies of the workshop notice package
3 and preliminary resource assessment are on the
4 table in the entrance in the back of the Hearing
5 Room. And that package contains today's agenda
6 and specific questions that will be addressed
7 during each section of the workshop.

8 There are three specific topics on our
9 agenda for today. First, discussion of the
10 preliminary Renewable Resources Assessment -- a
11 lot of tongue twisters in this today. Secondly,
12 the collection of information for the Renewable
13 Resources Development Report. And finally, the
14 discussion of how electricity generated by
15 renewables can play a part in the reduction of
16 greenhouse gases.

17 With that, I'd like to first ask
18 Commissioner Geesman, Chair of the other
19 committee, at this table today, if he'd like to
20 make any comments. And then we'll ask Chairman
21 Keese, who sits on the committee with me, if he
22 has any final comments. And then we'll let Mr.
23 Tutt moderate the day. Mr. Geesman?

24 COMMISSIONER GEESMAN: Thank you,
25 Commissioner Boyd. I think the primary thing that

1 I would say is that this is a tremendous start. I
2 think the staff, in the midst of all the other
3 things they have been doing jointly with the
4 Public Utilities Commission staff in support of
5 the Phase One RPS decision that the Commission
6 adopted last week, has put a lot of effort in this
7 preliminary assessment.

8 It is a living document in the sense
9 that we still do have a lot of work to do before
10 completing the development report this fall. But
11 it will form a valuable foundation for the Public
12 Utilities Commission staff to work on their
13 transmission plan.

14 And I think Tim and Drake and the rest
15 of the staff have done a phenomenal job in getting
16 this assessment to where it is now. I've got a
17 lot of questions to raise as we go on, and I'm
18 eager to hear comments from the audience.

19 I think, as everyone knows, transmission
20 is not something that California has done
21 particularly well in the past, and it will be a
22 vital component to our ability to achieve the RPS
23 goals. The important message, though, that I take
24 from this assessment is that the resource is
25 there, and the resource is likely to be

1 commercially available within the timeframe.

2 Not just of our statutory goals, but of
3 the accelerated goals established by the Energy
4 Action Plan. So I salute the good job that the
5 staff has done, and would invite the various
6 public comments that we'll get today. Thank you.

7 CHAIRMAN BOYD: Thank you. Chairman
8 Keese?

9 CHAIRMAN KEESE: Yes. This is
10 particularly appropriate that we're having this
11 hearing right here. The next preliminary meeting
12 between the PUC and the Energy Commission and the
13 Power Authority, I believe, is slated for July
14 17th, in about three weeks.

15 And as you're aware and was referenced,
16 the Energy Action Plan suggests that, instead of
17 using the 2017 target date, we should try for
18 2010. And how we do that as we integrate the
19 Energy Commission's roles in the Renewable
20 Portfolio Standard and the PUC's role in Renewable
21 Portfolio Standard will undoubtedly be a subject
22 for discussion in that meeting.

23 So I hope we can have a full discussion
24 here on all sides of that issue, from the audience
25 and our speakers, to let us know how we should --

1 whether or how we could implement that accelerated
2 target date. Thank you.

3 I will say, we can't really tell you --
4 if you've been at these previous hearings, we've
5 tried to tell the speakers how to handle the
6 system. We're over halfway towards getting a new
7 system. It seems to be working better, but we
8 really don't have any idea exactly how it's going
9 to work.

10 We think that if you can turn your voice
11 you can still get in, instead of having to speak
12 directly at it. So we'll go through here, we may
13 have a glitch or two today, but the system seems
14 to be getting better, and by next month we're
15 assured it will be perfect. Thank you.

16 CHAIRMAN BOYD: With that, Mr. Tutt,
17 it's all yours.

18 MR. TUTT: Welcome, everybody, to the
19 workshop. As technical lead of the Renewable
20 Energy Program I appreciate the kind words from
21 Commissioner Geesman. I want to echo that I
22 believe that the staff has done a phenomenal job
23 on this report.

24 And I particularly want to say that Pam
25 Doughman and Todd Lieber and Ann Peterson and

1 Drake have been the main people working on this,
2 and they've just done a fantastic job. So I want
3 to thank them for their work here today.

4 We have, as the Commissioner said, three
5 topics for this workshop. The first is the
6 preliminary Renewable Resource Assessment. We
7 will take those topics in order.

8 We will have a short presentation from
9 staff about each topic, and then be happy to have
10 public input, accept questions, answer questions,
11 and so forth, on the topic. I'd like it to be a
12 little informal if we could.

13 However, it requires -- with the
14 recorder here -- that you come up to the
15 microphone and speak if you're going to provide
16 comment to us today. And we would like you to
17 provide a business card also to the Court Reporter
18 when you do that.

19 There's material on the back table, an
20 agenda and the report itself and other packages if
21 you haven't gotten it already. And I hope we can
22 have an interesting discussion and get some input
23 that will help us very quickly deliver the
24 preliminary Renewable Resource Assessment, within
25 one week, to the Public Utilities Commission.

1 So keep your comments a little bit
2 short, because we don't have a lot that we can
3 incorporate in one week. And I would like to
4 introduce Drake Johnson, who's going to do a
5 presentation on the preliminary Renewable Resource
6 Assessment.

7 MR. JOHNSON: Okay. You can hear me,
8 right? Okay, good, good. I was going to do the
9 same -- acknowledge the same as Tim did -- but
10 it's true, people really put forth a heroic
11 effort. And I need to include -- Xenergy is our
12 consultant on one of the technical issues, and
13 their staff really put in a lot of extra hours at
14 a last-minute time to make sure we could meet this
15 deadline, so thank you to them also.

16 I kind of want to get this in a right
17 frame-of-mind. This particular assessment that we
18 did is not a resource plan, in the sense of the
19 traditional long-term forecasted resource plan.
20 This is really focused on renewables and
21 transmission.

22 It's focused primarily on the
23 relationship of renewables with the investor-owned
24 utilities, and the ESP's -- in our report we
25 called them ESP's -- and the community

1 aggregators, but really are direct access folks,
2 in the old world regime.

3 And the intent was to try and assess how
4 these folks would meet the requirements of the
5 RPS. So it's a very narrow snapshot.

6 We looked at three points in time --
7 2005, 2008 -- and then there was sort of this
8 beyond question, with the idea that when we do
9 transmission planning with a bigger picture view,
10 where would these things likely develop, and where
11 should we think about having questions like would
12 we put in a double circuit line or a single
13 circuit line, some of that kind of stuff -- in the
14 transmission plan.

15 Our effort was not to do the
16 transmission plan, but just try and make an
17 assessment of the potential supply of renewables.
18 So I'm going to go briefly over what we've done,
19 because there is a great deal of information in
20 the preliminary information we've done.

21 We could probably spend a day or two
22 going into all the details of fit, but I think the
23 point is, the objective here was to provide the
24 PUC and the investor-owned utilities and the ISO
25 enough information to do the plan that they're

1 required to do as part of the order instituting
2 investigation that's going on there.

3 And they need to get cracking on that.
4 So our objective is to try and make sure that this
5 gets handed to them in a way that we can work with
6 them and continue the process so that we all get
7 done at the end of the year.

8 And clearly the most important part of
9 today's meeting is feedback from you. We've read
10 it over and over to the point where we don't know
11 we've read it and don't see mistakes.

12 Just to go over it again -- I've briefly
13 mentioned, here's the objective. We're trying to
14 meet our commitment to the PUC and provide them
15 and the investor-owned utilities, the ISO's, with
16 adequate information. We committed to do these
17 time periods.

18 We also wanted to do some locational
19 development of where the actual resources might
20 be. And then to assess what this mix of supply
21 would be. I'll get into more details of that as
22 we go forward here.

23 The approach that we took was to first
24 determine what the energy needs were for the RPS.
25 And in general we did all of our analysis on an

1 energy basis until we got to the very end, and
2 then converted the energy into megawatts.

3 That way we didn't have these issues of
4 well, which capacity factor did you use, what sort
5 -- we just stayed all with energy, all the way
6 through our analysis.

7 And so first we determined the level of
8 need, and then we assessed, in that sense, the
9 existing potential and the proposed and renewable.

10 So we looked at the state's technical
11 potential, and then divided that up into sort of
12 three categories, which were the existing proposed
13 -- which we'll get back to in a minute on
14 definitions -- and then, after you subtract those
15 two from technical potential you end up with the
16 remaining potential.

17 And that's where we went with that. We
18 also did an assessment of out-of-state renewables.
19 And I will not spend any time on that today,
20 although what we did find is -- and the reason we
21 did this is because we focused this transmission
22 information on what would be going on instate with
23 instate renewables.

24 At the time we did this we were still
25 unclear as to exactly how any out-of-state

1 renewables would be accounted for, and there's
2 probably still some open issues about how that
3 would happen.

4 But what we did discover in doing this -
5 - and if you read the report -- there is
6 significant, more than significant there is lots
7 and lots and lots of potential renewable resources
8 in the WECC region that could serve us and other
9 states in that region.

10 And so, in terms of meeting RPS on
11 potential of energy available, I think when you
12 include the WECC clearly there should be no issues
13 that it's a doable item. And after looking at the
14 potential that we had, the next area was to try
15 and develop some plausible resource allocation of
16 the proposed and remaining technical potential.

17 And now I'll kind of walk you through
18 how we got to the first part, how did we assess
19 the need.

20 First of all, RPS is clearly an energy
21 planning question issue, it's not this sort of
22 traditional how many megawatts does it take to
23 meet the peak load, it's how much energy does it
24 take to meet the RPS requirement.

25 And the way we started out with, we took

1 one of our internal CEC forecasts, and the
2 objective was to determine what the target level
3 -- in other words, what this line was that we
4 needed to achieve.

5 We knew the end point. This is by
6 definition 20 percent of the 2017 retail sales.
7 We can get into debates about nuances of it, but
8 in general that was the end point.

9 So what we did was we gleaned through
10 public information that was available -- like FERC
11 form ones, filings that were with the Public
12 Utilities Commission -- and made an assessment of
13 what this baseline number was in 2001. And
14 calculated in that sense a percentage.

15 We knew how much the renewables were as
16 a percent for each of the investor-owned
17 utilities. And then compared that to an
18 assessment of what the retail sales were, and we
19 got a percentage number there.

20 so, for example, if a utility was maybe
21 ten percent or 20 percent of their 2001 retail
22 sales came from renewables. And that was our
23 starting point. And the way we made the line grow
24 now was that, in 2003, if it was ten percent in
25 2001, we said okay, the starting point in 2003

1 would be one percentage point later, it would be
2 11 percent.

3 And with that we took a look to see how
4 this procurement, whatever information we could
5 look at if it was public available, to see how it
6 fit. And that's how we established that. But
7 each year was an increase of one percentage point,
8 to determine this parted line.

9 And then we determined exactly what
10 would be the allocation for each of the investor-
11 owned utilities. And this information is found in
12 great spreadsheet detail in Appendix A. And
13 that's how we did that.

14 When we started to assess it also we
15 looked at the utility -- again with what we could
16 find of publicly available information -- if they
17 had achieved greater, in terms of this target
18 line, then under internal procurement they got
19 more.

20 In the case of San Diego they clearly
21 had, based upon the press releases and that kind
22 of information and data. So we used that
23 assumption in here so you won't see them procuring
24 any additional resources in our plan for 2004,
25 because we felt that they had made it.

1 Anyway, so that was how we proceeded to
2 develop the need part of it in what we were doing.
3 Then we also checked to see if you were growing at
4 this one percentage point per year growth rate, if
5 out here in 2017 you didn't achieve 20 percent
6 that would have meant you were a little short.
7 So, that happened to be, again, in the case of San
8 Diego that worked out. And what we did is we just
9 prorated the growth rate between those two points
10 a little bit, and increased it a little bit more
11 so that they would reach the 20 percent by 2017.

12 The world will probably end up different
13 than that, but that was our assumption. Now, I'm
14 going to probably confuse you here because I'm
15 going to switch left and right. So the first
16 thing, this next slide, is cumulative numbers.

17 These are what would need to be added to
18 cover the investor-owned utilities and the direct
19 access folks by 2005. And then the total,
20 including 2005 plus all the interim years, gets
21 you -- what you would need is 21,200 gigawatt
22 hours of additional energy.

23 I'll touch on this because I think the
24 graph helps us understand -- we did assume that,
25 in this baseline area, whatever interim was in

1 here either would be replaced in the process, we
2 did not try to define some kind of decay rate here
3 with an additional growth rate here.

4 But implicit in our assumptions is that
5 this amount of energy would either continue on --
6 one way it might be is that existing facilities do
7 efficiency improvements in some way and extend
8 their life and create that. Or that if they were
9 retired or came out of the market they would still
10 be replaced.

11 But the assumption was that what we
12 would be looking at would be this increment here.
13 And these would still be in the system someplace.
14 But we had no way of knowing how to do that.
15 That's probably a study for another day.

16 But from a transmission planning
17 perspective that's probably not a bad assumption,
18 because the transmission already exists for this.
19 And we're looking at how much more we need for
20 this here. So these were the cumulative numbers
21 that we came up with.

22 And when we did our analysis we did
23 assume that this was what each of the utility
24 areas would be to reach their compliance with the
25 RPS rules. We also assumed, when we did our other

1 analysis that the energy would move from places
2 where the production was to those utilities. And
3 all of it would not have to be sited within this
4 utility service territory.

5 MR. SKOWRONSKI: Mark Skowronski,
6 Solargenix. Drake, on the community choice
7 aggregator, you've got almost 12 percent shown.
8 What was your estimate of success of AB 117 on
9 that?

10 MR. JOHNSON: We didn't worry about
11 any -- the assumption was that this load would
12 exist. It would either be a community choice
13 aggregator --

14 MR. SKOWRONSKI: Oh, I see.

15 MR. JOHNSON: -- or it would fall back
16 to the utility. So rather than try to get ground
17 up in the details of who's going to win and who's
18 going to lose, we just lumped the two together and
19 figured it would still be the utility's load
20 service territory.

21 This isn't exactly the same organization
22 that was in our report. But in looking this over
23 I thought that this presentation it might be a
24 little more helpful. What we did here was try and
25 get an assessment of what the potential was, and

1 the overall technical potential.

2 And then to segregate that out into the
3 other components which were existing and proposed.
4 But just to give you a sense of what we looked at
5 in terms of technical potential.

6 The Commission had done -- in the year
7 2000 we had RAR perform a technical potential
8 study for us, and that was the one we were most
9 comfortable with as sort of our base point. And
10 that's why you see it as sort of our reference.
11 But at the same time we looked at California and
12 also the west, the WECC area, from the renewable
13 energy atlas study of the west, generating
14 solution study, the renewable energy of California
15 study, fuels from the sky, assessment of the
16 available wind and land energy potential in the US
17 -- these were a number of other sources that we
18 used, with Xenergy's help -- to try and get a
19 bandwidth of potential in terms of well, where do
20 we fit in all these different assessments.

21 Now, one of the things we discovered in
22 looking at these is there's all kinds of different
23 assumptions in them. Some of them assume, for
24 example, you can build something anywhere, in the
25 middle of a national park even. The sun shines

1 there, so maybe that's a source.

2 Another case is they've gone and cleaned
3 and said more specifically those aren't the places
4 where you can build, so they narrowed down the
5 potential. Some make other assessments of what's
6 available and how to do that.

7 But as you can see, there's a very wide
8 range of possible potentials. So given that we
9 had that information we took and looked on a
10 county-by-county basis where the amount of
11 existing facilities, try and identify their
12 location.

13 Also, this slide actually just picks
14 like the top 19 counties to give you a sense of
15 the existing renewables in these counties. I'll
16 move through these rather quickly. Here is a
17 proposed, I'll talk about that.

18 In terms of the proposed facilities what
19 we did was we tried to glean information from
20 publicly available sources. One example would be
21 our own, where we have the renewables program
22 here.

23 We had solicitations three times
24 recently in the last few years for the development
25 of renewable resources. We looked at what was

1 publicly available in terms of the internal
2 procurement. We looked at solicitations with the
3 SCAPA organization -- that's the Southern
4 California Power Authority.

5 So wherever we could find that kind of
6 information. We looked at some of the outside
7 ones, BPA had some solicitations, Sierra Pacific
8 in Nevada had done some stuff. So we tried to get
9 a sense of, in the short term i.e. the next few
10 years, what kinds of mixes of resources were
11 people coming forward with and offering to build
12 to meet these proposals.

13 Now, here again, unfortunately, not all
14 the requests for proposals had the same criteria.
15 So in some cases some recent resource types were
16 excluded. But in general it gave a sense of what
17 was happening here in the state of California in
18 terms of that.

19 And we used that as sort of a guide in
20 terms of what we might expect to be in the mix of
21 resources that we would see proposed to be built
22 in 2005 and 2008. Certainly what the mix of
23 resources to be built in 2017, I wish I had that
24 because I'd be making some pretty good
25 investments, you know, but unfortunately we won't

1 know that.

2 A lot of that will be driven by
3 different market considerations that we probably
4 haven't even thought of yet. But this was the
5 result of what we had seen in proposals of where
6 these resources might be located.

7 Then what we did was, from the total
8 technical potentials we subtracted from it the
9 existing and proposed that we had identified, and
10 this was what was remaining. Just to sort of see
11 how you rack things up here a little bit, what we
12 did was, this is sort of the resource side.

13 What we looked at here was the existing
14 renewables that we could identify through our own
15 resource allocations, were credited to the
16 investor-owned utilities and to the direct access
17 people.

18 One so we could identify what those
19 resources were. This was the remainder of the
20 state. And this was proposed new construction or
21 new forms of resources. And when we compared that
22 to the need, which was -- this is our assumption
23 about the baseline, this is what we saw in the
24 interim procurement, this was the amount we needed
25 to add by 2005, the next increment '08, and the

1 next increment 2017.

2 Now how did we arrive at the solution,
3 if you will, a plausible scenario. There's
4 probably as many plausible scenarios as we have
5 people here in the room. So, the way we
6 approached it, one of the things we looked at was
7 the investor-owned utilities.

8 And I used need along with the direct
9 access need, and we sort of lumped those two
10 together assuming that that requirement would fit
11 within that utility's boundaries. And then we
12 assessed also from that the energy supply for the
13 needs. What potential remaining energy supply
14 there was.

15 We looked at the proposal, and then the
16 last step after we did all this was to convert it
17 to capacity, through a capacity factor. And once
18 again, we did assume that energy from one source
19 could move from where it was plausibly easy to
20 generate or produce, would move either to that
21 investor-owned utility service territory or out of
22 it into others.

23 So the next three charts are actually
24 table four, essentially, in our report. We
25 couldn't put them all on one side so what we did

1 was we looked at, for the case of Pacific Gas &
2 Electric service territory, let's kind of get a
3 sense of, we know what we need for the sum of the
4 investor-owned utilities service territories and
5 their direct access folks.

6 We have a sense of where projects are
7 likely to be built based on the proposals, and the
8 type of projects that are likely to be built in
9 these time frames. So we started to max that up,
10 to see how we could do it. So this, on an energy
11 basis, is what we came up with for PG&E.

12 And in fact -- for what we did here, for
13 every one of these sources, we actually could
14 identify at least one proposal that tended to fit
15 in that category. So it isn't like we just looked
16 at this technical potential number and arbitrarily
17 applied it there.

18 Here is Edison's, I'll make note of this
19 right now. We show there's no remaining potential
20 here, which we have a concern with because we
21 already know that there's a significant amount of
22 interest in building additional resources in the
23 Tehachapi area, and it's at a high enough level
24 that these people have actually come in and met
25 with the transmission planning people.

1 So we understand that there's upwards of
2 3,270 megawatts of interest there. This slide
3 only represents about 2,500 megawatts of interest.
4 So I think we'll find out more today on how strong
5 the total number is there.

6 Then this other category -- like I said,
7 we looked at these 19 counties, but we had a bunch
8 of other resource locations. And in this case,
9 when we looked through them -- one of our
10 assumptions in terms of biomass was that, in
11 general, biomass plants aren't going to be a
12 hundred megawatt or 200 megawatt plant that's
13 going to need heavy transmission.

14 Chances are they would be spread out
15 throughout a service territory. A small, ten, 15,
16 20 megawatt kind of a plan. And therefore would
17 probably not be the focus of this kind of a
18 transmission study. Not that they wouldn't need
19 transmission to get there, but they're more than
20 likely to be spread throughout the system.

21 In the case of Imperial we separated
22 them out rather than lumping them in with Edison's
23 service territory, because they are their own
24 entity. Although they have tremendous potential
25 for geothermal development, and again we assumed

1 that at least that level of geothermal development
2 would leave Imperial County and go to serve some
3 other investor-owned utility.

4 And then last but certainly not least is
5 San Diego here. And there's the totals. So
6 that's the way we reached that point. And then
7 the totals add up to what we have there. As you
8 can see, I think what's interesting here is that
9 there's still a remaining potential within the
10 state of some 69,000 gigawatt hours.

11 These tables are just the previous --
12 this is our table five broken up. These tables
13 are just the conversion from the energy to the
14 capacity factor using 90 percent for geothermal,
15 35 percent for wind, and 80 percent for biomass.
16 We converted the energy to megawatts.

17 Bottom line is everybody wants to know
18 what the megawatts are. The idea was to use just
19 a capacity factor, and there's the total of the
20 megawatts increment needed. So, that concludes my
21 part of it.

22 If you have any questions, I'd be happy
23 to try and answer them for you. Two things that
24 we included in there, I'd like to just show in
25 addition to that.

1 As you know, we identified everything by
2 counties, and that was partly because the RER
3 report had great detail about county development.
4 Appendix B, this map, which shows geothermal
5 resources, and intends to show the major areas
6 where these are.

7 And as I recall reading through one of
8 the ISO's study plan, it sort of implied that if
9 you got within a hundred mile radius of where it
10 was going to go it would probably be okay. So
11 clearly this kind of information you're talking
12 about for Modoc and Siskiyou county we're well
13 within a 20 mile radius of where they might be.

14 So I think in terms of the sort of the gross
15 level transmission planning, we tried to meet the
16 bill here. These are in the report. All right.
17 So now I guess -- should I stay here for
18 questions, or --?

19 MR. TUTT: That might be good. You
20 might have to flip back to a slide if somebody has
21 a question about a particular slide. We're ready
22 to take questions. More than just questions,
23 comments, any input that you have for us.

24 I'll refer you to the notice in the
25 agenda. There's a series of questions. And we

1 can start off with the first question Please as I
2 said, come up to the podium here to talk if you're
3 going to comment to us.

4 And the first set of questions refer to
5 the locations that we've assumed in this report
6 for renewable resources. Are the locations that
7 we've included most likely areas of development?
8 Are there other locations that should be included?
9 What are your thoughts or feelings about how we've
10 done that?

11 I think particularly in relation to the
12 plausible scenario, the tables that Drake showed
13 near the end, where they had -- for PG&E for
14 example, development in Siskiyou, Solano, Modoc,
15 Alameda counties. And also in terms of the
16 potential in different counties. Tom?

17 MR. TANTON: Good morning,
18 Commissioners, staff. First of all, I'd like to
19 commend the staff for an excellent report. Having
20 done this in the past I --

21 CHAIRMAN BOYD: Well, it might be nice
22 to tell the audience who you are.

23 MR. TANTON: Excuse me. Thank you, Jim.
24 Tom Tanton, representing Vulcan Power here today.

25 MR. TUTT: Tom, can I interrupt you. It

1 seems that, since we do have this podium set up,
2 it might be reasonable for you to give any input
3 that you have on this one item, as opposed to
4 going questions by question here today?

5 And then we'll call other people, so
6 that we don't have to go back and forth and back
7 and forth.

8 MR. TANTON: That's fine. I think,
9 specifically to the question you pose, Vulcan
10 Power is concerned that some important geothermal
11 resource areas have been missed. They're
12 important both in terms of their resource
13 potential as well as the fact they're currently
14 subject of transmission studies, both with PG&E
15 and with Southern California Edison.

16 We have here today Mr. Paul Brophy to
17 talk about these resource areas a bit. And Mr.
18 Munson, CEO of Vulcan Power, to make some summary
19 comments.

20 But overall the report is excellent,
21 it's a tremendous first step towards a renewable
22 resource development report, and will provide the
23 CPUC important information as they go through
24 their transmission planning activity.

25 But we are concerned that, by missing

1 some resource areas, there's a potential for
2 winners to be selected essentially,
3 unintentionally, by virtue of some getting
4 transmission access through the plan and others
5 not.

6 So we want to make sure that it is in
7 fact a comprehensive resource assessment. So if
8 we could maybe hear a few words from Paul Brophy
9 on these resource areas?

10 MR. BROPHY: Yes, I'm Paul Brophy with
11 Geothermal Resources Council and with Vulcan
12 Power. One of my concerns -- it's not really a
13 concern, it's more of a comment and observation --
14 is that the evaluation of the geothermal resources
15 seems to be confined to those areas that are
16 already either developed or have some sort of
17 geothermal development associated with them.

18 And it seems that the assumption is
19 being that all future geothermal resources are
20 actually going to come from these areas. I did
21 note you have the new geothermal resources map
22 shown on the screen there. But geothermal
23 resources are always very difficult to evaluate
24 just simply because of the nature of their high
25 upfront costs for discovery.

1 And what I would like to see is a more
2 thorough technical evaluation -- I don't know how
3 that can be done -- of the future potential
4 geothermal resources.

5 In the slide that shows the investor-
6 owned utilities, under other wind, other
7 geothermal and other biomass, we see that the
8 future potential for geothermal is probably
9 somewhere in the region of about a tenth of the
10 other two fuel sources.

11 And that I think comes from the nature
12 of geothermal. I'd like to give an example, and
13 this is an example that Vulcan Power has been
14 working on. One of the largest potential resource
15 areas, although it's not identified on that map,
16 is an area in northern California called Mount
17 Shasta.

18 Mount Shasta represents a geologic
19 setting that 90 percent of the other geothermal
20 systems around the world are set in. Yet, because
21 only one or two companies have done any work in
22 that area it doesn't show up on the map.

23 Now, I can understand that between now
24 and 2005 there might be limited opportunities for
25 brand new geothermal resources to be developed

1 just because of their lead time. But certainly by
2 the time 2008, and definitely by the 2017, I think
3 we can see substantial amount of power generated
4 from areas that are not covered in pink on that
5 map out there.

6 And the reason why they are not
7 included, as I say, is just simply because of the
8 nature of trying to discover these resources.
9 Basically, in summary, the RPS has given the
10 geothermal industry an opportunity to move forward
11 and do some work on some of the resource areas.

12 They're not like wind or biomass that
13 can easily be identified. They need lead time to
14 be able to identify them and to be able to
15 demonstrate their existence. And perhaps in the
16 report some more focus can be given onto those
17 potential areas such as Mount Shasta that have a
18 potential for producing large amounts of power, at
19 least within about three or four years time.

20 And not base the geothermal resource
21 evaluation just purely on expansion of existing
22 projects. Thank you.

23 MR. TUTT: Thank you, Mr. Brophy. Be
24 assured that this is the preliminary renewable
25 resource assessment, that we will be updating and

1 looking at potential again for other areas for the
2 renewable resources development report. You might
3 hear more about that this afternoon.

4 And I'd also like to say that this is
5 the first time that we do this. Surely this will
6 not be the end report on renewables in California.
7 Steve?

8 MR. MUNSON: Steve Munson, Vulcan Power
9 Company, CEO. We have specific comments more to
10 exact language in this draft report that we would
11 like to see changed. We have expended a great
12 deal of time and money in California and adjacent
13 states to develop baseload geothermal.

14 On page 18 of the draft report, in the
15 proposed renewable generation section, we believe
16 that you should consider adding Shasta County as a
17 geothermal proposed site in the amount of 240
18 megawatts. This is based on a number of comments
19 that we submitted in written form to this draft.

20 It includes the advanced stage of that
21 project in the proposal process to multiple
22 utilities, the signed letters of intent with
23 California Power Authority, and the scope and
24 potential impact of that large resource at Shasta.

25 It also has to do with transmission.

1 Transmission is a directly related issue. We have
2 studies underway by PG&E for a constraint removal
3 at Cottonwood that would open up on the order of
4 240 megawatts of new transmission south, from the
5 Shasta area. So we believe that it's both a
6 resource and a resource-related transmission
7 restraint issue.

8 We also believe that there are at least
9 300 megawatts of transmission available from west
10 central Nevada into California into the SCE
11 service territory, based on a transmission
12 constraint study that we have funded with Edison.

13 And we believe that that at least should
14 be reflected in summary form in this report. The
15 potential for 300 megawatts of baseload geothermal
16 coming into the state as particularly relevant,
17 given the phase one findings, the recent decision.

18 We also believe that page 19 of the
19 report, also dealing with proposed renewables,
20 should be modified. We would like to see at least
21 300 megawatts at 95 percent availability added to
22 the Nevada chart. In other words, increase the
23 renewables to reflect that constraint removal
24 project.

25 I think most of us in the room know

1 about the longstanding constraint removal project
2 north of Lugo, and that's what we're relating to.
3 There is additional line open north of that.

4 We also believe that the Oregon chart on
5 that same page should be modified as well to
6 reflect the well-known Newberry volcano project in
7 Oregon that has proposed at least 240 megawatt of
8 sales to California. There's rather an easy
9 transmission pathway, there are probably contract
10 issues at COB, of course, that we would have to
11 deal with.

12 But we can get on to the Lapine
13 substation from that resource site. We ask for
14 those changes in this report before this report is
15 issued in final form.

16 MR. TUTT: Thank you. You have
17 submitted written comments to that effect on this
18 report, or --?

19 MR. MUNSON: Yes, we have.

20 MR. TUTT: Okay, thank you.

21 MR. MUNSON: Thank you so much.

22 MR. TUTT: This gentleman here?

23 MR. ROMANOWITZ: I'm Hal Romanowitz.

24 I'm President of the Kern Wind Energy Association,
25 and also President of Oak Creek Energy Developer.

1 And, as you know, on the charts Kern county was a
2 substantial resource. And it was clear from the
3 charts that you've done really a quite good job in
4 trying to define things, but were struggling to
5 try and resolve the issues.

6 And I have put together some information
7 to help you in that respect. And we just filed
8 last night, to the docket office -- and I have
9 copies here that we can pass out so you have
10 additional documentation.

11 But the Kern County resource, we have
12 gone through and detailed it out step by step. As
13 had been mentioned, there has been very
14 substantial transmission planning that has gone
15 forward in Tehachapi. There has also been very
16 substantial environmental work, so that the core
17 for development is far along in Tehachapi.

18 so that projects can be done. There has
19 been a significant transmission constraint issue,
20 and we're working to break that down. The
21 Tehachapi area is served primarily by a very weak
22 transmission system which needs badly to be
23 upgraded.

24 And there is, in addition to that, a
25 secondary transmission of a superior nature,

1 actually, both with LADWP and with a private line,
2 one of the two private lines in the state. In the
3 resource numbers that we have put down, for the
4 2005 period, it will be the existing transmission
5 and maybe a little bit of additional capacity that
6 can be realized.

7 And that will, we believe, exceed the
8 numbers that you have in your report by a bit.
9 And for 2008 and beyond the numbers are
10 substantially greater. We've documented the
11 numbers in detail.

12 In the report you show 2,500 megawatts
13 as the potential for Tehachapi, and that is the
14 number of megawatts that were reported in the
15 phase one and phase two SCE transmission
16 conceptual studies. There is an additional 770
17 megawatts in the phase three conceptual study.

18 There is 270 megawatts on the LADWP line, and
19 some other small pieces that actually bring the
20 Tehachapi total that is currently in active
21 development, active preparation, that could come
22 to market fairly quickly. It is 4,060 megawatts.

23 And we have been using for some time the
24 number 4,000 megawatts of wind energy available
25 from the Tehachapi area. So that the two are

1 actually fairly consistent. All of these projects
2 are identified. They are developers that have put
3 money on the table to have studies done, to have
4 environmental work done, and so on.

5 So these are real projects, real land
6 identified and so on. So that it's a very
7 significant and viable resource for California.
8 It is located only about 40 miles remote from the
9 Los Angeles Basin, so that there is a need for
10 transmission, but it is really not so remote.

11 There is, as you know already, 650 megawatts
12 of very successful wind energy developing and has
13 produced from the early 80's in Tehachapi. So the
14 public is exposed, accustomed to the wind
15 turbines, supports it. There is substantial
16 public support. There is substantial political
17 support for the development.

18 So I think -- we do compliment you on
19 the work that you've done, and I think we can help
20 you resolve with the supplementary information
21 that we've given you you can see specifically
22 where the projects are disclosed. And they have
23 all been disclosed publicly, so that that
24 information is available. Thank you.

25 MR. TUTT: Thank you.

1 CHAIRMAN KEESE: May I ask one question
2 here?

3 MR. TUTT: Yes, I'm sorry. Go ahead.

4 CHAIRMAN KEESE: Your suggesting that
5 perhaps the number should be greater? Are you
6 suggesting that it's also going to come on faster
7 also?

8 MR. ROMANOWITZ: Well, I think the total
9 number should be greater, and the potential -- in
10 fact, one additional thing I'll mention here.
11 There's at least a thousand megawatts beyond what
12 is identified in projects now, so that the total
13 resource potential is at least 5,000 megawatts
14 going out into the future.

15 So it's really double what you have
16 shown.

17 CHAIRMAN KEESE: And in what time frame
18 are you talking?

19 MR. ROMANOWITZ: Right. Okay. The 2005
20 timeframe, because of transmission constraints, I
21 think that the numbers that you have in your
22 report for 2005 are approximately reasonable.
23 They probably should be a little bit larger.
24 Maybe 25 to 50 percent larger, but not
25 dramatically larger.

1 The 2008 timeframe, you could have
2 easily the 4,000 megawatts available, so that the
3 2008 timeframe, there's a lot more potential. We
4 are working closely with SCE on the transmission
5 conceptual studies, so that there are viable
6 transmission plans.

7 Really the issue is how to facilitate
8 and have a rational and orderly expansion program
9 so that you get the transmission available for the
10 area.

11 There are issues of transmission line.
12 One double circuit line is at least 1,400
13 megawatts. And individual projects typically are
14 smaller -- you know, 50, 100, 200 megawatts -- so
15 that there's a problem of how you get that first
16 investment going forward. And it's a pretty major
17 issues to help break that loose.

18 In the hearings that we had a couple of
19 weeks ago at the Public Utility Commission on
20 phase six of the transmission hearing process --
21 which was on Tehachapi -- we had substantial
22 dialogue on customer reliability issues and we
23 think that there is a very strong justification to
24 do things to help customers as well as to make the
25 renewable supply available.

1 So there is a mechanism to make things
2 happen near term, but it takes a push. There's
3 been 15 years of inertia, where transmission has
4 been an ongoing problem in Tehachapi, and it has
5 not been broken loose yet.

6 And I think that, with all of the
7 planning that's going on it's clear that, where
8 you have such a dominant resource, and that
9 transmission is the primary bottleneck, it needs
10 to be a very critical focus on how to get this
11 broken loose and move forward.

12 And we do have lots of thoughts on the
13 subject, and we can work with the staff and work
14 with you to help facilitate it, just as we're
15 working with Cal ISO and with Southern California
16 Edison.

17 MR. TUTT: Hal, can I followup on that?

18 MR. ROMANOWITZ: Yes.

19 MR. TUTT: By 2008, you hope for or
20 anticipate a transmission breakthrough or push to
21 get a line built that will allow the 4,000
22 megawatts of potential to come out of Tehachapi.
23 But will the 4,000 megawatts actually be there by
24 that time, or could they be?

25 MR. ROMANOWITZ: The 4,000 megawatts

1 could be there in 2005 if you had transmission.
2 In other words, the environmental work has been
3 done. The resource assessment has been done, and
4 these projects are there. Now the 4,000
5 megawatts, to get them all by 2005, that's not --
6 certainly you could get 2,500 megawatts by
7 2005. Recognize that there's two or three
8 anemometers as a minimum up in Tehachapi. Just
9 tremendous measuring of the data. So that you
10 have bankable resource there. You have a resource
11 that's proven.

12 And you have a political motivation
13 where the forces of significance in Tehachapi, in
14 Kern County, want to see wind developed. So it's
15 all there. It's really a primary transmission
16 bottleneck is really the thing that's keeping it
17 constrained.

18 MR. TUTT: Thank you. In the very back?

19 MS. PETTY: I'm Susan Petty from Black
20 Mountain Technology. And I too would like to
21 comment on how excellent a job this report is,
22 particularly for a first pass. It's really
23 addressed many of the issues, and I think helped
24 us to think about what we mean by potential for
25 renewables.

1 My comments particularly address the
2 geothermal location and assessment of the amount
3 of potential geothermal power. When we talk about
4 potential renewable energy we have to be precise
5 about what potential means.

6 Here we've termed this the technical
7 potential, yet I think that in some way we made an
8 economic judgment. We have here the maps and
9 tables, seven counties with geothermal potential
10 and about 11 geothermal sites. In other
11 assessments we see as many as 40 geothermal sites
12 in as many as 14 counties.

13 I think what may have happened is that
14 we have cut off those geothermal sites which don't
15 have existing development with the idea -- which
16 is probably reasonable -- that the best sites,
17 the ones that are most economic and the ones that
18 will be developed the soonest, are those which
19 already have developments.

20 But by no means are they all the
21 geothermal sites, nor all those that can be
22 economic. In the recent bids in the Nevada RPS
23 situation, geothermal sites that were undeveloped
24 were bid for power prices as low as four and a
25 half cents a kilowatt hour.

1 That, I think, brings us to the real
2 issue here, that when we talk about the potential
3 for renewables we are talking about two things.
4 One, the technical potential and the other is the
5 economic potential. By making the decision to
6 include sites that already have development or are
7 close to those that have development we've made an
8 economical judgment.

9 And one of the ways around this is to
10 take all of the sites, from other studies, and use
11 the information that's available on them to
12 calculate the cost of power from these sites. And
13 this could be done for wind or any of the non-fuel
14 renewables that are tied to a resource as opposed
15 to tied to a fuel cost, and develop supply curves.

16 Supply curves show a cost of power and
17 an amount of power available at that cost. And
18 that would get us around the problem of making
19 some kind of cutoff and saying this isn't
20 technical feasible, when what we really mean is
21 this is uneconomic right now.

22 I agree with the person who just talked
23 about the wind situation in Kern County, that
24 transmission is a huge issue. It's a huge issue
25 for geothermal and for wind, because these

1 renewables are tied to sites, they're tied to
2 specific locations. And if those locations are
3 not right near a transmission line, or don't have
4 good transmission access, it can add enormously to
5 the cost to generate power from these sites.

6 Studies that I've been involved with
7 show that the cost of 50 miles of transmission
8 line can add from one and a half to two cents a
9 kilowatt hour to the cost of power from a
10 geothermal project, according to land acquisition
11 cost. So it might be useful, if we develop these
12 supply curves, to consider the cost for power for
13 these renewable technologies with and without the
14 transmission cost added for each site.

15 And this sounds like an enormous task,
16 but in reality it's something that's been
17 undertaken periodically by the Energy Information
18 Agency on a much larger scale than state by state.
19 They do it by the federal regions.

20 And they have developed models which
21 they update periodically, and are in the cycle of
22 updating right now to use to calculate the cost of
23 power from the different technologies.

24 And it might be a useful thing to talk
25 to them and use their models to be more specific

1 in the state of California by costing the sites
2 that we do know of and have information about to
3 get a better idea of what the real potential is
4 but tied to a cost.

5 MR. TUTT: Thank you, Susan. Nancy and
6 then the gentleman in the back.

7 MS. RADER: Good morning. Nancy Rader
8 with the California Wind Energy Association. I
9 wanted to echo what was just said. My feeling in
10 reading the report was that the major missing
11 element was any kind of assessment of relative
12 cost.

13 Both among the resources, and also
14 within the resource, and even within a resource
15 area. So within a resource area there can be
16 different qualities of resource with associated
17 cost. And it's important, I think, to inform the
18 PUC's decisions on credit trading and transmission
19 for them not only to know how much is there but
20 also how much does it cost.

21 And that's going to be a critical factor
22 in the credit trading decision, and certainly in
23 transmission. So I would agree with the supply
24 curve idea of at least having some relative sense
25 of the cost of generation that's coming out of

1 these different areas.

2 My other point is on the issue of the
3 potential in each area. Our feeling is that the
4 San Diego County wind resource that you show in
5 the report is too low by at least a factor of two.
6 That's based on the experience of some of our
7 members and consulting meteorologists in the area.

8 We feel like it's at least 1,000
9 megawatts there. And then finally, it's related
10 to the notion that there should be more
11 information on the relative cost of the different
12 resources. I would urge you to reconsider the
13 sort of prejudgment about imposed resource
14 diversity.

15 I think we need to inform the
16 Commissions about the relative cost of the
17 resources so that will inform whether there should
18 be enforced resource diversity, because it matters
19 how much that diversity costs. So if there's not
20 too much difference in the cost of three resources
21 it makes more sense to have enforced resource
22 diversity.

23 But if there is a large cost it makes
24 less sense. And one other point I guess is that
25 in addition to information about resource quality

1 and cost is to know something about the match of
2 the resource to load. We should have that
3 information coming out of the studies that you are
4 shepherding now through UC Davis.

5 So I think that would also be an
6 important determinate. There is a statement in
7 the report that says that certain technologies
8 match the generation profile of some conventional
9 resources, and therefore they were factored into
10 these scenarios.

11 But I don't think it's significant that
12 there's a match with conventional resources. What
13 matters is whether there's a match with load. So
14 those are my comments on this topic. Thanks.

15 COMMISSIONER GEESMAN: Nancy, I'm
16 curious. You've not made any mention of what I
17 actually thought of as the primary missing
18 resource in the report, and that's wind
19 repowering. And I wonder if we aren't all kind of
20 slipping past a rather large, untapped potential
21 resource.

22 Do you have any sense as to the
23 magnitude of opportunity there?

24 MS. RADER: We do, and we have
25 calculated the potential for repowers. And I

1 think that our assessment is that you could add a
2 billion kilowatt hours to the system. And I think
3 our estimate is that we could add 450 megawatts
4 equivalent in increased production within five
5 years.

6 So thank you for pointing that out. And
7 of course -- except Tehachapi, which I think would
8 require some expansion to get some of that repower
9 potential -- I think there is sufficient
10 transmission potential in Altamount, and perhaps
11 Palm Springs to get some of that out. Buy maybe
12 Hal has more on Tehachapi.

13 COMMISSIONER GEESMAN: Well, I certainly
14 think, from a transmission planning standpoint --
15 accessing some of the repowering sites may prove
16 cheaper and faster than some of the new
17 transmission lines that will be required in the
18 Tehachapi area.

19 I don't want to take away from the
20 priority attached to new transmission in the
21 Tehachapi area, but I also think that it's
22 important from the state's standpoint to proceed
23 as economically rationally as possible, and I'm
24 just puzzled as to why aren't we repowering more
25 of these wind sites now?

1 MS. RADER: Well, I can tell you why.

2 And that's because there's a provision in the
3 federal production tax credit that prohibits
4 projects from getting a production tax credit
5 unless they get a contract amendment from the
6 utility.

7 COMMISSIONER GEESMAN: But that's an old
8 provision. I mean, Congress is looking at the law
9 now, aren't they?

10 MS. RADER: Yes, and they're looking at
11 extending the production tax credit without
12 provision in it.

13 COMMISSIONER GEESMAN: Why would that
14 make any sense?

15 MS. RADER: We don't think it does make
16 sense, and we would like to see it removed. And
17 I'd be happy to talk to you about our efforts
18 there. That provision was implemented in 1999.
19 There were roughly 280 megawatts repowered prior
20 to that date, and as soon as that provision was
21 instituted, there have been 11 megawatts
22 repowered.

23 So it has just brought repowering to a
24 screeching halt, and we would like to see that
25 reversed. We're encouraged by the PUC's statement

1 in the RPS decision of last week or so that
2 encourages some movement on this issue, but
3 frankly I'm not sure how much movement we can get
4 without removing that federal roadblock.

5 COMMISSIONER GEESMAN: And what's the
6 cause for the roadblock? I know you can't --.

7 MS. RADER: Southern California Edison
8 is the one that initiated that provision in 1999.

9 COMMISSIONER GEESMAN: Manual, could you
10 at some point today address that? Not now, but at
11 some point before we close I would like to
12 continue this dialogue and try to get a better
13 understanding of what might be different now from
14 1999.

15 I can think of a number of things that
16 might be different. Thanks, Nancy.

17 MS. RADER: Thank you very much.

18 MR. LIDEN: Good morning. My name is
19 Bob Liden, and I'm with Stirling Energy Systems.
20 And we represent some concentrated solar power.

21 I appreciate the report, and the fact
22 that there's been a clear assessment of the long-
23 term potential for solar, but was a little
24 concerned that, in doing any of the analyses that
25 might lead to transmission feasibility studies and

1 so on that essentially solar was eliminated from
2 any of the discussions about new resources that
3 might become available over the next 15 years.

4 And certainly there's a lot of work
5 being done in many states and in many countries to
6 try and bring the cost of solar down, particularly
7 the cost of concentrating the solar-thermal type
8 power down to where it's very competitive with
9 other alternative both renewable and non-renewable
10 resources.

11 And I would certainly hope, our company
12 is banking on the fact that we're going to be able
13 to do that pretty effectively for the coming
14 decade. And we have several projects that we've
15 been working on.

16 They are still in the early development
17 stage -- but that might involve both production
18 within the state of California and also
19 neighboring states like Arizona on Indian
20 reservations that are bringing power into the
21 state of California.

22 So I would hope that in the feasibility
23 studies that are to follow this report that there
24 would be some recognition of the potential of
25 solar.

1 And it's dismaying in some sense, and
2 it's also reassuring in another sense, that your
3 report shows that, in all of the renewable
4 resources, you can add them all up and they come
5 up to be far more than the total amount of power
6 that we really need in the state of California or
7 even the Southwest -- or in the nation for that
8 matter.

9 And I would hope that California will
10 continue to take a leadership position in trying
11 to encourage an ever-increasing percentage of
12 renewables as they become feasible both from an
13 economic standpoint as well as a technical
14 standpoint.

15 So I just want to make sure that you
16 don't leave solar out of the equation somehow
17 simply because there aren't any good projects
18 going on in the development stage right now.
19 There will be, I promise you. Thank you.

20 MR. JOHNSON: Yes, I guess that's
21 fortunate or unfortunate, I don't know whether
22 that is. But anyway, as shown in our algorithm,
23 we looked for proposals and unfortunately there
24 were no identified proposals.

25 And then our fundamental thought about

1 solar in general was that it's sort of spread in
2 smaller units across the state, but that's not
3 true.

4 A central receiving type of technology,
5 which I think you're speaking to -- and to the
6 extent you can add to the body of our knowledge in
7 terms of if there are geographically more isolated
8 locations where they're more likely to develop as
9 opposed to just sort of this, you know, there's a
10 lot of sun over the state of California concept,
11 that would be helpful.

12 And then to the extent that you can add
13 sizing and timing relationships then it would
14 certainly help us add more information about the
15 potential.

16 MR. LIDEN: Very good. I know you cited
17 as one of the sources that you looked at was fuel
18 from the sky report. And that does in fact do an
19 analysis of some of the strongest potential solar
20 sites in California, where they would be.

21 And they're obviously in the
22 southeastern part of the state for the most part,
23 at least for concentrating solar power. And I'll
24 be glad to try and add some more information for
25 you as well.

1 CHAIRMAN KEESE: Let me ask --
2 geothermal is geographically sited, and wind is
3 geographically sited. Are you suggesting that
4 concentrated solar would be that selectively
5 appropriate, or you have an ability to move next
6 to the transmission line?

7 MR. LIDEN: We have, particularly with
8 the dish technology, which is what our company
9 produces, the ability to scale projects. So they
10 can be very small, 25 kilowatts all the way up to
11 a few megawatts or even hundreds of megawatts.

12 In this way we can move them to sites
13 that are much closer to local transmission lines
14 and don't require some sort of a massive high
15 capacity transmission line. Other concentrating
16 solar power technologies like trough systems and
17 tower systems do require a somewhat larger size
18 plant and therefore some larger transmission types
19 of requirements.

20 Having said that, there is within the
21 general technology of solar/thermal as opposed to
22 PV's, more of a need to have a very high direct
23 solar installation type of resource. That is, one
24 where there's less clouds, less diffused light
25 that might come from areas where there's higher

1 humidity, coastal areas and that type of thing.

2 So that's why I say that, really, the
3 general sites for concentrating solar power tend
4 to be more in the desert areas of southern and
5 southeastern area, as opposed to up around the San
6 Francisco Bay Area for example or in the northern
7 California areas.

8 CHAIRMAN KEESE: Right, but it would
9 just seem to me, naively, that as you get started
10 in concentrated solar, that you would have sites
11 that could be pretty close to transmission -- that
12 for that area of renewables, the transmission is
13 not quite as significant as it is for the
14 geothermal and the wind.

15 MR. LIDEN: That is absolutely correct,
16 sir. And we are looking at doing some smaller-
17 sized projects, even here in the Sacramento area,
18 and in other cities down near southern California
19 main city ares.

20 Now, our dishes are not -- the 25 KW
21 dish that we have is about 36 feet in diameter.
22 So I don't want to mislead anybody into thinking
23 that this is something that's easily put on
24 somebody's rooftop or in the back yard of their
25 house. It's clearly an industrial-sized thing,

1 and it does have to deal with these not in my
2 backyard type issues.

3 It's more specifically designed for
4 remote applications, but there's still a lot of
5 remote applications that are not too far away from
6 population centers in California. So that's
7 certainly an area where we're going to target a
8 lot of our initial builds. Thank you.

9 MR. TUTT: Thank you. Steve, and then
10 Todd?

11 MR. KELLY: Steven Kelly with the
12 Independent Energy Producers Association. And I
13 recognize that you have a report that's due in
14 about a week, so I'm actually thinking longer term
15 here in terms of the preliminary assessment and
16 how to make this a better planning tool.

17 I think you heard some comments today
18 that suggest that, while the technical assessment
19 of what's possible in California and the western
20 region is helpful and informative, it really
21 doesn't take you to the point of being as valuable
22 as you might make your work product.

23 And I think it gets back to what
24 Commissioner Keese was pointing out, too, that the
25 other dimension is time. We have unlimited

1 technical potential, but the real question is when
2 can you bring these on, and what's the probability
3 of bringing a project on within the timeframe that
4 you're looking at.

5 And what I'd recommend doing in terms of
6 future reports is trying to develop more of an
7 analytical rigor about the probability of bringing
8 projects or resource area pockets so that they can
9 serve California consumers.

10 I'm thinking that the probability of
11 building a project in a state park or a federal
12 park on in a Indian sacred site is a lot less than
13 the probability of bringing a project on that's
14 someplace out of those kinds of locations because
15 they have huge constraints to doing that.

16 Similarly, in the interim procurement,
17 one of the winning bidders was a project that I
18 believe requires a PUC 851 proceeding, that
19 details an investiture of a utility asset and
20 transfer it over to a non-regulated entity. That
21 is potentially something that will at minimum
22 require a great deal of time, and may not happen
23 at all.

24 So there are some factors that I think
25 you need to use to shield the scope and scale of

1 the resource that's out there that could be
2 brought to bear to serve the RPS requirements. It
3 will take us some time to develop what those
4 factors are, but simply a developers proposal,
5 or -- in the lack of some sort of resource
6 assessment behind it -- is in my mind ought not to
7 be sufficient to be included into your report as
8 RPS feasible.

9 It may be technically feasible. there
10 is a lot of solar out there. There's a lot of
11 wind, there's a lot of geothermal, every
12 technology probably has a lot of potential, but
13 I'm thinking more in terms of RPS potential and
14 being able to bring it on in 2005, 2008 and 2017.

15 And I think we need to develop some
16 criteria for that. So it's just an observation at
17 this point, and I understand we're not going to be
18 able to make changes for this preliminary
19 assessment. But down the road, it would be very
20 helpful I think.

21 MR. O'CONNOR: Good morning,
22 Commissioners. Good morning, staff. My name is
23 Tom O'Connor, I'm here on behalf of Solargenix.
24 Joining me is Mark Skowronski. Solargenix is a
25 company specializing in the production of

1 solar/thermal central plant products and systems
2 primarily.

3 And we too applaud the staff for
4 assembling a lot of information, trying to
5 synthesize it within a very tight framework, and
6 putting parameters around it on how you implement
7 the RPS.

8 And our comments are to help to make
9 this document -- even a preliminary report -- a
10 more robust and comprehensive report than it is in
11 its present form. Our specific comments will deal
12 with the draft language.

13 We have answered some questions
14 regarding the research needs, and we'll defer that
15 discussion until later in the day. But our
16 specific response has to deal with the draft
17 language. We believe, though the intent was
18 there, the report lacks alignment harmony with the
19 very recent CPUC/RPS decision.

20 Or to use another word that's favored,
21 it's not integrated with that decision. In order
22 to determine the accurate assessment of renewable
23 technologies for the value they currently and
24 potentially provide to California in terms of
25 fulfilling SB 1078 we believe that technology

1 should be discussed in terms of addressing
2 utilities' load requirements.

3 And that echoes Nancy's comments that we
4 need to have this report get to the products that
5 utilities are going to be offering -- whether it's
6 baseload, peaking -- as available or firm. And
7 also we ask that the report be harmonized with
8 projected energy demands.

9 It's very similar to the point I made
10 before. Transmission plan is conducted to assure
11 the development of adequate and reliable
12 infrastructure to meet energy demand.

13 And I make reference to the California
14 Power Authority's 2002 Energy Resource Investment
15 Plan, "relying on CEC data, projects load growth
16 to increase from 1,000 megawatts to 1,500
17 megawatts by 2008." The preliminary draft does
18 not assess how the identified technologies can be
19 utilized to meet this projected energy demand.

20 We also have some concerns about the
21 data and some of the conclusions and assumptions
22 that were used and offered in the report.

23 On page 11 the draft concludes, and I
24 quote, "while solar/thermal, photovoltaic and
25 other renewable technologies may participate in

1 future solicitations, they do not appear
2 significantly in the empirical data examined
3 here."

4 "Based on this information, staff
5 concludes that solar is not likely to provide
6 substantial supply to meet RPS demand in 2005 and
7 2008."

8 We believe that statement should be
9 deleted, for several reasons. One, it's
10 inaccurate, it's inappropriate and not consistent
11 with the requirements of SB 1078 to predetermine
12 how the RPS will be met. As previously mentioned,
13 RPS demand will be met through IOU solicitations.

14 We believe based on product, baseload
15 peaking as available. This statement, and this
16 report, does not recognize that scenario. The
17 statement disregards the value solar/thermal
18 provides as a peaking product.

19 Furthermore, in the fuel from the sky
20 report that Drake cited, that report projects an
21 increase in energy demand in California of 266,883
22 gigawatts per hour in 2001, to 337,635 gigawatts
23 per hour in 2010.

24 Of this increase, the same report
25 forecasts peak demand to increase in California

1 over this decade from 52,805 gigawatts per hour to
2 66,804 gigawatts per hour. The draft failed to
3 mention how this increase in peaking demand will
4 be met.

5 We also disagree with the statement
6 cited above because empirical, relevant data
7 relied upon by staff does in fact indicate that
8 solar/thermal can play a substantial role,
9 providing substantial supply as a peaking product.

10 We believe that the draft relies on
11 incomplete data to justify not including
12 solar/thermal. In Chapter Three, titled
13 "Existing, Proposed and Potential Renewable Energy
14 Generation In California" the WECC fails to
15 include information available from some of the
16 same resources relied upon by staff mentioned on
17 page 11 on existing, proposed and potential
18 solar/thermal power projects.

19 Some of the sources cited were CPA
20 Letters of Intent, Southern California Public
21 Power Authority, solicitations to Nevada and
22 Sierra Pacific RFP's, IOU testimony for the CPUC.

23 And they are addressed in the following
24 way, "with regard to CPA Letters of Intent, nearly
25 two years ago, in the fall of 2001, the CPA, in

1 one of its first official acts, issued requests
2 for bids for certain renewable technologies. The
3 RFO requested bids for wind, biomass, geothermal."

4 "In issuing the request for bid, the CPA
5 indicated that the RFB for large-scale solar will
6 be issued later. It did not occur. However,
7 earlier this year Chairman David Freeman, in
8 testimony before the California State Energy and
9 Commerce Committee, advocated the use of
10 solar/thermal as a hedge against the volatility of
11 natural gas supply and prices."

12 Under the Nevada RPS, Solargenix has
13 recently signed a contract with Sierra Pacific for
14 50 megawatts of large-scale solar/thermal power to
15 be on line by 2005. And there's an attachment in
16 our written documents that cites a press release.

17 The SCAPA RFP, Lasher Solargenix --
18 operating under its former name of Duke Solar --
19 submitted a bid to SCAPA proposing an 80-megawatt
20 turnkey solar power facility that will begin in
21 2004, or within 18 months after contract is
22 finalized.

23 The plant will be located in the Mojave
24 Desert at Harper Lake in two existing 80-megawatt
25 plants. Two options were proposed for electricity

1 delivery -- to the ISO SP15, or to a tap from the
2 500 KV Meade/Adelanto line, which runs within two
3 miles of the proposed site.

4 And also, with respect to the RPS energy
5 requirements cited on pages 8 and 9 of the report,
6 Solargenix recommends that Edison's testimony from
7 the long-term procurement proceeding before the
8 CPUC also be cited and included.

9 In that proceeding, Edison testified,
10 and I quote, "the objective of its long-term
11 renewable procurement planning program will be to
12 add new renewable capacity equivalent to one
13 percent annually on a megawatt basis of SCE's peak
14 demand, or up to 200 megawatts."

15 This testimony indicates that Edison
16 will initially use its one percent procurement
17 obligation for addressing its peak demand. And
18 Solargenix is currently in discussions with one
19 California-based investor-owned utility.

20 We have another concern about some of
21 the text, and it's on page 25. The draft states,
22 "the emphasis of the information regarding
23 technical potential is identification of resources
24 that are geographically concentrated."

25 The draft further states that, "other

1 renewable resources, such as solar, will be
2 located throughout the state and will need to be
3 assessed on an individual basis, since they will
4 most likely not create the need for major
5 transmission upgrades themselves."

6 We respectfully recommend that these
7 statements be modified. The statement is
8 factually inaccurate to the degree it appears to
9 bundle all solar together.

10 While the placements of PV's, which are
11 distributed in nature, can be and have been
12 located throughout the state, this statement
13 cannot be applied to solar thermal central power
14 plants, as evidenced today by the 354 megawatts of
15 solar thermal power plants located in the Mojave
16 Desert.

17 CSB plants will be geographically
18 concentrated in various desert areas in
19 California, particularly in southern California,
20 in order to optimize solar radiant availability.
21 And with that I'll conclude my remarks, and I
22 appreciate your attention.

23 MR. TUTT: Thank you, Tom. The woman
24 right here?

25 MS. TURNBULL: Chairman, Commissioners,

1 staff, I'm Jane Turnbull, and I'm here today
2 representing the League of Women Voters of
3 California. I would like to commend the staff on
4 a superb report.

5 However, there is -- from the League's
6 point of view -- one area which seems to be
7 absent. And that is a comparison of the extent to
8 which distributed resources can displace
9 transmission.

10 There is a great deal of public
11 resistance to additional transmission out there.
12 And there is a lot of misunderstanding in terms of
13 the need for new transmission. The passage of SB
14 1078 was hailed as a victory by the green
15 community, the environmentalists out there.

16 And the vision was solar PV on every
17 roof, and you know, small winds in everybody's
18 backyard. Failing to accept the large renewables
19 out there. And so I too felt that the absences of
20 solar in the report was a real absence.

21 I also personally, from the other side
22 of my life, felt the absence of biomass digesters
23 was a defined absence.

24 In both cases, those would be very
25 small-scale, you know, less than five megawatt

1 contributions. And so, in a sense, when you're
2 dealing with 21,000 megawatts, five or ten
3 megawatts is not going to make a lot of
4 difference.

5 On the other hand, in the terms of how
6 the public perceives the development of
7 renewables, I think it is valid to include small-
8 scale generation in the package, at least mention
9 of its legitimacy. But also, I would suggest that
10 there be some kind of assessment in there.

11 And I think supply curves are always a
12 good way to go, to show how distributor
13 generations can fit into the package and to what
14 extend they are going to make a difference. Thank
15 you.

16 MR. TUTT: Thank you, Jane. I want to
17 assure you that we are engaged in a fairly
18 comprehensive study of the value of renewables in
19 avoiding transmission. And you might hear more
20 about that, if you are able to stay around later
21 today.

22 George Simons from our PEER department
23 will talk a little bit about that project. We're
24 moving forward on that.

25 MS. TURNBULL: Good. Thank you.

1 MR. TUTT: The man in the back corner.

2 MR. SCHUMACHER: Commissioners and
3 staff, I'm Brian Schumacher from the PUC. My
4 transmission engineers in my group will be working
5 with the ISO and the CEC to develop the
6 transmission plan, which will be in our report
7 required by the legislation.

8 The first thing I want to do is thank
9 the Energy Commission, and Drake in particular,
10 for developing this report in time to give the
11 utilities and ourselves the time to prepare a
12 report by December 1st. And there's still a lot
13 more work to do with all of these groups.

14 I just have a few comments. In the
15 draft that we have now, the data in table five --
16 this is an e-mail that I did send to Drake
17 yesterday -- my comment is simply one of
18 specificity. The work that you've done in four
19 months is terrific.

20 That said, to the extent that the
21 developments can be identified closer to existing
22 substations it will assist the transmission
23 engineers to develop their transmission plan.

24 Since we are very close to your June 5th day
25 at this point, I would add that to the extent that

1 significant changes might be needed or an
2 opportunity to make your report more accurate
3 appears, we would simply ask that you let us
4 know -- and of course the IOU's -- as soon as
5 possible, even as something begins to emerge.

6 Because -- I'm sure it's clear that once
7 the utilities themselves settle in on certain
8 figures to designed for, that any major changes
9 would be difficult to accommodate.

10 My only other comment at this point
11 would be to echo one of the earlier speakers with
12 respect to the cost of renewable technologies.
13 Your report of June 5th, I believe, if you were to
14 append that, formally recognize it among the many
15 other reports that the Energy Commission produces,
16 and call attention to it, I know that we'd
17 appreciate it.

18 And others at the PUC who aren't aware
19 of it would find it useful.

20 MR. TUTT: Brian, I just want to
21 make it clear, you're referring to the cost of
22 generation report the Energy Commission did?

23 MR. SCHEIBLE: "Comparative Cost of
24 California Central Station Electricity Generation
25 Technology." June 5th, it's on your website.

1 MR. TUTT: Thank you. Mark?

2 MR. SKOWRONSKI: My name is Mark
3 Skowronski, Solargenix. My colleague Todd
4 provided the legal input to the report, and I just
5 have a few generalized comments regarding
6 solar/thermal.

7 I started in 1989 in the solar industry
8 as a project director for the Solar Two Project,
9 when I was employed by the Southern California
10 Edison company. I got a pretty good feel on both
11 the power tower and the solar pump technologies,
12 both from a technical and economic standpoint.

13 I'd like to point out -- as Greg pointed
14 out -- there's 354 megawatts of solar trough
15 existing. And the first trough went in in 1981.
16 And in the 20-odd years later, we've made very
17 significant improvements, both in reliability and
18 the economics of building and running a plant.

19 The cost proposal that we gave to SCAPA
20 in November for an 80-megawatt plant -- price is
21 proprietary, but based on CEC cost estimates in
22 both capitol and the methodology they used, the
23 all-in pricing concept -- we actually were a
24 little bit lower based on the market price
25 reference for combustion turbine running at 25

1 percent capacity factor.

2 Based on the assumptions of fuel, and
3 also the fact that we had the advantage of missile
4 financing, which is obviously very significant
5 when you talk about a capitol-intensive technology
6 such as solar/thermal.

7 The contract we have with Nevada, as
8 Todd points out is 50 megawatts -- we're in
9 discussions with them for another 50 megawatts.
10 We have two square miles at Harper Lake. We have
11 options for land at the old George Air Force Base
12 for additional acreage.

13 And we're talking to appropriate people
14 in northern California and the San Diego service
15 territory to acquire additional land. As
16 Commissioner Keese pointed out, we are somewhat
17 more flexible than wind or geothermal.

18 We can move the plant, so to speak,
19 that's closer to a transmission line, which
20 obviously would facilitate the cost, if we just
21 have to reconduct our line or something like that
22 as opposed to going into virgin territory and
23 making transmission.

24 So, we feel we're cost-competitive. We
25 provide peaking power. We follow the sun. One of

1 the things we're looking at to enhance the solar
2 technology today is to hybridize ourselves with
3 combined cycle.

4 If you're familiar with the technology
5 of combined cycle they normally have what they
6 call duct firing. And duct firing is a way you
7 just put fuel in the -- it's kind of like an
8 afterburner -- and you make more steam. And
9 afterburning basically occurs during peak days.

10 You follow the sun basically with
11 afterburning. And to hybridize a solar plan with
12 a combined cycle basically gives you the best of
13 both worlds. There's a lot of cost synergies, a
14 lot of cost reductions, the economies of scale
15 associated with it.

16 And I just want you guys to keep an open
17 mind, and hopefully we can include that in the
18 report. Thank you very much.

19 MR. PIGOTT: Good morning, I'm Jack
20 Pigott with Calpine. And I just had a couple of
21 comments. And they all relate to the geysers.
22 First of all, in the chart that shows existing
23 generation, under Lake County -- and I assume that
24 you mean Lake and Sonoma -- it looks a thousand
25 gigawatt hours a year short.

1 And I'm wondering, perhaps you haven't
2 included the NCPA plants or --. But based on our
3 current generation levels it looks 1,000 gigawatt
4 hours short. There is potential for additional
5 expansion at the geysers, as I'm sure you're
6 aware.

7 The geysers is a liquid constrained
8 resource, as opposed to heat. We are about to
9 start the Santa Rosa pipeline. There'll be 11
10 million gallons a day of water coming in there,
11 and we expect that to have an impact. And on top
12 of that there is additional potential in parts of
13 the field that just haven't been drilled.

14 The number that I think we gave the
15 governor's office earlier this year, or it might
16 have been last year, was an expansion potential of
17 200 megawatts, and that's at the expected price
18 levels of some of the other projects that you have
19 included.

20 CHAIRMAN KEESE: Can you give us a time
21 on both of those?

22 MR. PIGOTT: Well, the Santa Rosa
23 pipeline is going to become operational in
24 October. And we'll see what happens there with
25 regard to potential expansion. All we need are

1 the power contracts, and we'll then look probably
2 four years out from there.

3 So if contracts are available, and I
4 think it's feasible that they could be online in
5 the 2007 or 2008 timeframe. One benefit of the
6 area is that there is plenty of transmissions.
7 It's not constrained.

8 It was built for 2,000 megawatts, and
9 there's a little under 1,000 there now. The
10 issues, of course, are all a matter of price. If
11 price were no limit I'm sure there's all kinds of
12 expansion capabilities there.

13 And various constraints and things to
14 look at are expansion of the production tax credit
15 to include geothermal, which is currently in the
16 federal energy bill. There are provisions for
17 royalty relief, and I think that will impact
18 geothermal throughout the state.

19 And of course the way that your own
20 rules are worked out to see whether any of this
21 generation can compete. I'd be happy to answer
22 any questions.

23 MR. TUTT: You talked about potential
24 for expansion in the geysers, and if I understand
25 what you're talking about, it's building new

1 facilities in parts of the field that haven't been
2 developed yet. So that doesn't --

3 MR. PIGOTT: Well, that is part of it,
4 but you have to remember that -- of all those
5 plants up there we have roughly 2,000 megawatts of
6 plants for 1,000 megawatts of generation. So
7 there is a certain amount that can be gained.

8 The heat is still there. Drill deeper,
9 inject some of that fluid at depth and find
10 permeability. And we have seen evidence from
11 several wells that it's there, that really the
12 potential is there to -- if price were no object
13 -- to greatly expand the area.

14 MR. TUTT: Okay. Joe, did you have your
15 hand up?

16 MR. KLOBERDANZ: Mr. Chairman,
17 Commissioners, Tim Drake, Joe Kloberdanz for San
18 Diego Gas & Electric. Just a few brief comments.
19 First of all, I commend the staff. This is not an
20 easy task, and you're not done yet, but good
21 start.

22 In particular, for our little corner of
23 the state, SDG&E service area, primarily San Diego
24 County, we think you've got it about right. We
25 see the biomass and the wind additions coming in

1 based on people that are talking to us, things we
2 hear. It comports more or less with what we think
3 we know about these days, today, that looks like
4 it might happen.

5 We show in the potential column some
6 biomass amounts. Ms. Rader has mentioned
7 increments of wind potential. Both of those kind
8 of go beyond what we know anything about today,
9 but they're in the potential column. And that's
10 okay.

11 If they move into the reality column in
12 one of the study years that would be fine too.
13 San Diego welcomes seeing some of the generation
14 coming into its service area. Too little of the
15 renewable actually is showing up in our service
16 area. It will make us more reliant on
17 transmission.

18 Our transmission planners, therefore,
19 are prepared to develop the transmission plan that
20 the PUC has to develop by December of this year
21 based on what we see in these columns right
22 now. Just one final observation. We've heard a
23 lot of talk today from wind developers, geothermal
24 developers, and even some solar developers talking
25 about the need for transmission. This is not a

1 transmission-friendly state. That probably comes
2 as no news to any of us in the room.

3 Some of these facilities might be able
4 to be located closer to existing transmission, but
5 a lot of what we've seen on the maps, a lot of
6 what we've heard talked about today, will not. It
7 has to be where it is. And sometimes there's not
8 enough transmission there.

9 We're going to need to do something in
10 this state. As someone who is responsible for my
11 company, for getting transmission licensed through
12 the regulatory process, I can tell you we're going
13 to need to do something about that. It doesn't
14 work really well right now.

15 It's difficult. I'm not blaming
16 anybody. But we're going to have to look at that
17 as a state. Because what we're trying to do on
18 these maps, you can't ignore the transmission
19 aspects of it. Thank you.

20 COMMISSIONER GEESMAN: I wanted to thank
21 you for your comments, and would encourage you to
22 continue to make those comments about transmission
23 in various forums. I'm actually of the belief
24 that you can blame somebody, and you can blame
25 certain institutions.

1 And we're probably unlikely to be
2 prodded into fixing the situation before that
3 blame is clearly assigned. I don't think that we
4 serve your ratepayers particularly well in the way
5 that we've approached these questions.

6 And I think in response to the woman
7 from the League of Woman Voters, in recent years
8 we haven't even gotten to the tough questions on
9 transmission planning. We're yet to get to actual
10 bona fide siting decisions. We've been balled up
11 in need determinations with somewhat bizarre time
12 frames applied to it.

13 And all of these problems are going to
14 be multiplied when we try to develop renewable
15 resources. So I would thank the gentleman from
16 San Diego Gas & Electric, and encourage you to be
17 a little more pointed next time. Because we need
18 the prodding.

19 CHAIRMAN KEESE: I will just add that
20 Commissioner Geesman is doing a very good job of
21 starting rocks sliding down the hill. What we
22 need is the landslide. We are seeing movement.
23 At this point I'd say the movement is of the
24 glacial nature, going extremely slowly.

25 But I think if we can get a mindset

1 change, which -- I confer with Commissioner
2 Geesman -- if we can change the mindset of how we
3 do transmission planning, I think we can start
4 making significant progress. And at least two of
5 us here are very committed to that.

6 MR. TUTT: Gentleman over there?

7 MR. VERDON: Thank you very much. My
8 comments will be brief. Understandably, the
9 report is focused on the more traditional sources
10 for renewable energy, --

11 MR. TUTT: Could you state your name?

12 Oh, I'm sorry. Excuse me. My name is Hal Verdon
13 with Novi Industries in San Diego. Wind, solar,
14 geothermal. My question is are you considering
15 outside the box, in the non-traditional areas, in
16 some of the emerging technologies?

17 Specifically plasma arc waste
18 destruction that utilizes municipal solid waste as
19 a source for conversion efficiently to synthetic
20 gas that would be used in gas turbine generators.
21 It's something that I've gotten rather excited
22 about and have recently become involved in.

23 It eliminates the problems with
24 municipal landfill toxic emissions, greenhouse
25 gases, the whole recipe. And I would encourage

1 the Commission to look at that possibility for
2 energy development for California. Thank you.

3 MR. TUTT: Sir, do you have a business
4 card you can give us?

5 MR. VERDON: Yes.

6 MR. TUTT: Go ahead.

7 MR. MORRIS: Hi, Commissioners and
8 staff. I appreciate the opportunity to make a
9 couple of comments. My name is Gregg Morris, I'm
10 from the Green Power Institute. And I regret that
11 I haven't had enough time to really go through the
12 report in the detail that I'd like to.

13 But my preliminary observations and
14 concerns are in the following area. And that is,
15 as far as I can tell based on what I have gone
16 through so far, you're using a very low growth
17 rate for electricity.

18 And I'm concerned in so doing we're
19 underestimating the requirements of what it will
20 take for the state to comply with the RPS. And I
21 just -- for example, in doing projections that
22 I've done, have used the Energy Commissions 2002-
23 2012 electricity outlook report.

24 And for example, in that report the
25 statewide estimate of retail sales in 2012 is

1 approximately 327,000 gigawatt hours. And your
2 table, and your appendix, shows only 283,000
3 gigawatt hours for 2012.

4 And that's a 16 percent difference. And
5 as far as I can tell -- again I don't know exactly
6 what drives the new projection -- but it looks to
7 be very close to one percent growth rate for the
8 next 15 years in electric demand. And I must say,
9 I sincerely hope that's too low.

10 Because if that's the case that means
11 our state's going to remain in the economic
12 doldrums for the next 15 years. So that's concern
13 number one.

14 And concern number two is that you're
15 focused almost exclusively on the IOU's. And
16 indeed you acknowledge that SB 1078 is a statewide
17 mandate. And while a lot of the early
18 implementation focus has been at the CPUC and even
19 here at the CEC on the IOU's, we need to be
20 looking at this from a statewide perspective.

21 And particular if we do get the REC
22 trading that I think a lot of us expect will
23 happen, it allows the best renewables in the state
24 to serve the whole state. And so I think if you
25 focus only on the IOU's you're kind of forgetting

1 the fact that we need this other large increment
2 of new renewables as well.

3 And it all happens together. It doesn't
4 happen as separate chunks or separate processes.
5 So, like I say, at this point my main concern is
6 that we're underestimating the amount of new
7 renewables that are required.

8 I also see that you're about 15 percent
9 higher than I am on terms of what should be in
10 that baseline. And most of my data -- of your
11 data -- I haven't had a chance yet to figure out
12 where are the discrepancies.

13 I would request that you consider
14 splitting biomass as you have it now, into two
15 categories -- solid fuel biomass, and gas biomass,
16 which is mainly land fill gas but also does
17 include digesters of various kinds. Thank you.

18 MR. TUTT: Thank you, Gregg.

19 CHAIRMAN KEESE: Can I make the
20 observation that that's a net figure. And even if
21 -- you were a little vague on the numbers so I
22 can't respond -- but, one percent growth, maybe
23 two percent growth and one percent efficiency
24 savings.

25 So the fact that the electricity demand

1 grows by one percent does not necessarily mean
2 that that's the limit of growth.

3 MR. MOORE: No, I know. But for
4 example, like I say, your output for --

5 CHAIRMAN KEESE: If there is a
6 discrepancy that's clear.

7 MR. TUTT: Is there someone else that
8 wishes to talk about this report today? Yes,
9 ma'am.

10 (unintelligible question from audience)

11 In response to that, I started out
12 thinking that maybe we should address question
13 one, perhaps go through question by question, but
14 then I realized that that would require people to
15 come up to the podium several times.

16 And I suggested that people address all
17 their comments when they step up to the podium on
18 all the questions. If you have comments on some
19 of the other questions feel free to come back up
20 if you missed it the first time.

21 MS. HICKS: I'm Lyn Harris Hicks from
22 San Clemente in Orange County, and I'm here to
23 express from the standpoint of the homeowner,
24 citizen, active in various organizations.

25 And my appeal today is that when we are

1 making a report on the energy futures of
2 California, it gives us an opportunity to do some
3 leadership in guiding the course that we will take
4 in our energy future.

5 And in this report it appears to me that
6 the assessments and the needs and the hopes -- the
7 hopes are not there as much as they could be.

8 When I talk with people in my organizations,
9 and my neighbors and friends and family and so
10 forth, I think the general opinion of our
11 citizenry is that we are too much into big
12 installations-type of energy production.

13 That we need to have a very active
14 energy conservation campaign that is ongoing, not
15 just when we have the threat of blackouts or
16 something. That we need to have a very broad
17 education program for our citizenry. And
18 including our children in our schools in that
19 line.

20 And that we need to pursue, invest in,
21 the distributive forms of generation. We wonder
22 why we don't have solar rooftop generation on all
23 of the federal buildings and the city buildings
24 and the county buildings and the schools and the
25 industries.

1 And we think that if that were made a
2 project of the state of California, with
3 investment not only saying we can have rebates and
4 so forth, but pursuing it, going to the big
5 industrial companies and saying we can provide
6 this on your roof and it will provide for you and
7 it will give you security.

8 Because people are thinking a lot now
9 about security, with the terrorist world now. And
10 it sort of makes obsolete a lot of our planning
11 and thinking that we've gone along with over the
12 years, because the large, the really large nuclear
13 and oil-based generation is target.

14 And we know it is true. I am
15 particularly concerned because I live two miles
16 from San Onofre. But the homeland defense report,
17 the analysis, stated that nuclear power plants
18 were the most vulnerable targets.

19 And we're talking now not just about '08
20 or whatever, but probably for several generations
21 at least. I think it will take us a long time
22 before we solve that problem.

23 So it looks to me as though -- and I
24 think to most citizens -- that we must begin to
25 rapidly free ourselves from dependence on the oil

1 and nuclear generation. And the only way that we
2 see that is practical for that is the rooftop
3 solar generation, the wind and the neighborhood
4 type of generation.

5 With the others of the renewables being
6 very important. But the solar should be the
7 primary thrust. And I'd like to have our state
8 leaders saying that in reports on our energy
9 future. And setting forth a plan to achieve
10 it. The problem right now, in my view,
11 is that we on the local level in the Energy
12 Commission, the PUC, the legislature of the state,
13 are not taking an active role in the legislation
14 that's coming in the Senate of the United States.
15 That energy bill has worked its way through to the
16 point where it's about to be approved. And
17 they'll put as much as 16 or 18 billion dollars
18 into resurrecting the failed nuclear technology.

19 And that money should be put in rooftop
20 solar generation. And there should be some way
21 that we can change the course that we're on.

22 MR. TUTT: Thank you, ma'am. Appreciate
23 your comments. Yes, sir?

24 MR. VELARDE: My name is Antonio
25 Velarde, and I'm with Southern California Edison.

1 I just would like to commend Drake Johnson and the
2 staff on preparing. An excellent job on these
3 renewable resources.

4 I have only a few questions, and one of
5 them is they mentioned about Orange County
6 geothermal, and we'd like to know a little more
7 specifics on that, as far as locations. So that
8 we can assess whether we need to look at whether
9 there's going to be a transmission constraints for
10 that, if it ever develops.

11 There was also some question before on
12 our repowering of wind generation, and I just want
13 to mention that a couple of years ago, even before
14 the passage of AB 1078, we have been working with
15 the Wind Developers Association to develop
16 conceptual transmission studies to integrate.

17 Initially they had said that they had
18 1,000 megawatts of wind generation in the area of
19 Tehachapi. And in order to break the circular
20 loop of taking developed generation if there is
21 transmission is that we need to know where they
22 are in order to develop the transmission plans for
23 those.

24 We agreed to develop conceptual studies,
25 and eventually the thousand megawatts grew to

1 2,500. And that's what we have developed for the
2 conceptual studies. And we have done a phase two
3 of that in order to determine the environmental
4 requirements for some general routing and general
5 siting of substations.

6 And we have done some preliminary
7 environmental assessments in these general
8 corridors and general areas. But certainly we
9 still need to do some specific environmental
10 assessments and evaluations in order to file a
11 CPCN.

12 In the beginning of the wind park
13 development they were using a lot of small units,
14 like 50 kilowatts. It grew to 100, 150 kilowatts,
15 250 kilowatts. Today they are now installing 1.5
16 megawatts, or 1,500 kilowatt units, and you can
17 see they are really assured of their technology.

18 And we have no doubt that they can
19 develop that. The only concern we have is in the
20 conceptual studies we did for these development of
21 transmission plans for the renewable program.

22 We had asked for interest in developing
23 conceptual studies. And we did get similar
24 amounts of resources, renewable resources, that
25 participated in our studies. Which resulted in

1 3,270 megawatts for the Tehachapi wind park alone.
2 And today they are talking about 4,000 megawatts,
3 and even 5,000 megawatts.

4 We surely would like to know right away,
5 sooner than later, whatever the Commission's going
6 to allow to be included in the final report. We
7 did put in some flexibility in our conceptual
8 studies.

9 We started with 230,000 volt
10 transmission lines for the phase one and phase two
11 conceptual studies for the initial 2,500
12 megawatts. We also have included an alternative
13 for 500,000 volts of transmission option, in case
14 they do go to 3,270 megawatts.

15 And I imagine if you go to 4,000 we
16 would have to make some more modifications for
17 that. But we are already preparing to work on the
18 studies in order to confirm our initial conceptual
19 studies to the Commission final report. We have
20 looked at the draft report, and it seems like we
21 do have enough information to start that work.

22 We will be waiting for the final report
23 to see what the final numbers are going to be.

24 COMMISSIONER GEESMAN: Are you a
25 transmission planner, sir?

1 MR. VELARDE: I manage the transmission
2 planning for the internal network.

3 COMMISSIONER GEESMAN: Do you have a
4 sense of what magnitude of transmission upgrades
5 would be necessary to accommodate repowering at
6 existing wind sites, say in the San Geronio area?

7 MR. VELARDE: Well, today we have about
8 3,000 kilowatts of actual demand or total output
9 from the wind park. If you consider that we are
10 already planning for 3,270 in the last study that
11 we did, and we will probably be doing studies for
12 4,000 megawatts if you allow the 4,000.

13 That should be well within the
14 capability of the system that we will be
15 developing.

16 COMMISSIONER GEESMAN: Thank you.

17 MR. ROMANOWITZ: Hal Romanowitz, Kern
18 Wind Energy Association and Oak Creek Energy
19 again. And, since I was up earlier I had talked
20 about the resource, and there were a couple of
21 other points I wanted to make that some people had
22 talked on, but I think that there's some
23 significant input that hasn't been discussed by
24 others.

25 And one of the critical things that I

1 think you need to look at as you put together a
2 plan and we figure out how to get renewable energy
3 into the market.

4 And the big thing is the cost issue.
5 And there is a very major difference in the cost
6 of developing wind projects based upon how the
7 rules are set up in the structure of the program.

8 For example, if you go from say a 50
9 megawatt to a 100 megawatt or a 200 megawatt
10 project you maybe are changing the price in the
11 order of a half to three quarters of a cent per
12 kilowatt hour.

13 When you take a very large resource like
14 Tehachapi, and you look at the very large scale of
15 it, and you combine it with transmission costs,
16 that there is a very significant economic
17 advantage to try and bring forward a very large
18 block of energy. And this can make some very
19 major differences in how much gets developed.

20 I believe that, if it's done correct,
21 and the market opportunity is allowed to develop,
22 and the rules are set up so that it can develop,
23 you can get a very large amount of wind energy out
24 of a place like Tehachapi that's very, very
25 competitive. It might be the price leader of any

1 technology.

2 That wind from a good resource like
3 Tehachapi is inexpensive. And when you facilitate
4 large developments you can drive the cost down,
5 and you can get some great economics that way.

6 A second point is that the market rules
7 do not foster firming of energy, generally. There
8 is great disincentive, for example, to firming of
9 energy. And our company in particular has been a
10 leader in looking at the issues, working at it.

11 We have some projects that we believe we
12 will get off the ground in the very near term that
13 will be dramatic, but their scale is going to be
14 limited because the market rules strictly turn it
15 down.

16 In the interim RPS we were prepared to
17 bid some substantial firmed wind energy projects
18 and couldn't bid them because of the rules. And
19 we ended up just not spinning our wheels and
20 didn't bid. But we had some significant projects
21 to bid and could not do so.

22 And the disincentive to firming is
23 really substantial. And I believe that there is
24 less of a need for technology development than
25 there is for market development, market

1 opportunity. That if you can create the
2 opportunity for firming you will get significant
3 firming of wind energy.

4 And to help SCE in their transmission
5 planning, if you do firming of the wind energy --
6 like in Tehachapi -- you will find that the
7 existing transmission plans that they're doing
8 will cover the area very nicely.

9 That firming, in addition to the
10 transmission, will take care of and allow much
11 better utilization of the existing transmission
12 resources.

13 And the other thing is that, again, if
14 you can combine the repowering with the firming --
15 again, even a place like Tehachapi could make a
16 pretty significant contribution immediately with
17 the existing transmission.

18 That there is transmission capacity
19 available in Tehachapi when you allow firming to
20 fit within the matrix.

21 MR. TUTT: Hal, when you speak of
22 firming, are you talking about storage on site in
23 some fashion?

24 MR. ROMANOWITZ: Storage on site is the
25 simplest form from a rules standpoint. But the

1 best firming is where you do it within the
2 geographical region. There are major barriers
3 right now, where you have very tight rules on
4 where you interconnect.

5 And it makes no difference to the
6 transmission network, but the contractual rules
7 are tight and very strictly enforced. And so it
8 really gives us lots of problems on flexibility,
9 on how we can move things around.

10 And we have right now 16.6 megawatts of
11 contract capacity that's in limbo just because of
12 these flexibility rules. But there are a lot of
13 other opportunities to firm if you don't have the
14 same point of interconnection.

15 And specifically in Tehachapi, for
16 example, we have a 500 megawatt storage project
17 that is just sitting essentially dormant because
18 there is no way to physically bring it into the
19 market.

20 We've looked at pump storage and we have
21 three projects with property that we either own or
22 have tied up. We just can't do them because we
23 have to -- you turn the pumps on, or your
24 generating, and wind is variable, and the two
25 don't mix.

1 And the rules just totally make it
2 economically non-viable, and it's a major problem.
3 So we're going forward with other storage
4 technologies to do the firming that we will do in
5 the near term, but there are a lot of
6 opportunities where the rules just block it.

7 And even within, where we can make the
8 technologies work -- we believe within the
9 contractual rules. Edison is just raising all
10 kinds of barriers that say well, it's going to
11 make the energy too expensive when you deliver it
12 on peak.

13 So they fight it, they make it
14 uncertain, and we have a very hard time taking
15 that crawl step. And the way that you get firming
16 in large scale is crawl and walk, then run.

17 And the technology is clearly there,
18 we're ready to do it, and we're having a hard time
19 getting these crawl steps. So facilitating the
20 quality of the energy that you need is really an
21 important thing. And that's going to save you a
22 bundle on transmission. It's going to make
23 Edison's job a lot easier.

24 MR. TUTT: Hal, Thank you. Yes, the
25 lady in the back? Yes, ma'am.

1 MS. THOMAS: Good morning,
2 Commissioners. I'm Chifong Thomas from Pacific
3 Gas and Electric. I'd just like to make a few
4 comments. First off, it's a very good report,
5 staff did a very good job. And we can use that
6 information to do the transmission studies in
7 conjunction with the ISO and CPUC and the
8 stakeholders and the other utilities.

9 But it must recognize that, since there
10 are a lot of uncertainties in this report, a
11 reconnaissance type report, and the transmission
12 planning study that comes out cannot be more
13 accurate than the data that goes in. But it will
14 give a general direction of where we're heading on
15 the transmission side, based on this scenario.

16 It is comforting to know that there are
17 so many renewable resources in the state. PG&E
18 would be, actually we are very happy to see that
19 there are so many renewable resources in the
20 state, so we can meet our obvious goals.

21 And one thing that needs to be included
22 in the transmission cost is a part of least cost
23 estimate. And it should be included as a total
24 cost of the energy delivered. I have said that
25 the transmission needs to be in place in an

1 orderly manner, so we wouldn't go on building
2 transmission lines up and down the state.

3 Timing is very important, it needs to be
4 fit to the timing of the resources, because if you
5 were to build something that turned out to be not
6 needed in the future that certainly is not good
7 for the ratepayers.

8 So we really would like to encourage the
9 renewables to locate in areas that have less
10 transmission impact. That would be a winning
11 situation for everybody. Thank you.

12 MR. MUNSON: Steve Munson, Vulcan Power,
13 second set of comments. I'll try to keep them
14 brief, there's a lot of ground to cover. The
15 first issue is the renewable industry, as well as
16 everyone in the room, wants to see a grid that's
17 good for green and good for the grid.

18 We want to see benefits and upgrades
19 that bring this system into the modern age. The
20 wind industry just made a comment that I totally
21 agree with. We need to do everything that we can
22 to facilitate the quality of this transmission
23 system. Facilitate the quality of the energy.

24 And that talks about firming up wind and
25 providing baseload. There was, of course, earlier

1 comments that wind should capture even a larger
2 portion of this market. I note the staff has done
3 a 60 percent wind, 25 percent geothermal, 15
4 percent biomass mass estimated split on resource
5 type.

6 I would suggest for consideration that
7 we should certainly not give any larger portion of
8 this market to wind, because we need a grid that
9 works at the end of the day, and that's baseload
10 power.

11 We have massive quantities of geothermal
12 available, both instate and out-of-state. And we
13 should not create a situation here where we have
14 power that we can't count on. And our company and
15 others certainly have no knock on wind, we need
16 wind.

17 It's a question of how's the grid going
18 to work. At the end of the day the grid has to
19 work. We would like to point out that there were
20 no questions about transmission asked implicitly,
21 even though the direction of this entire study is
22 to provide input on the transmission system.

23 We would like to advise the senior
24 members of regulatory bodies here that are not
25 aware of the direction of the transmission docket,

1 because it hasn't come up yet in formal
2 proceeding, that we have requested as a company
3 that two renewable transmission constraint removal
4 projects get equal footing as we go forward with
5 year with the Tehachapi project.

6 And we would suggest again that those
7 two constraint renewable projects are essentially
8 north of control, coming down that well-known
9 constraint line in the Mammoth area.

10 As I mentioned earlier, we believe,
11 based on an SCE preliminary study done for our
12 company, that 300 megawatts of baseload could come
13 down that line. And we would like to suggest that
14 that be a serious consideration as we bring these
15 joint transmission and resource studies together
16 this year.

17 We also suggest that the well-known
18 constraint north of Cottonwood be similarly
19 treated. 240, 300 megawatts can come down that
20 line of baseload geothermal and baseload biomass.
21 And we ask that these things be mentioned in the
22 report, it's certainly not in the draft.

23 With respect to the question of where
24 can out-of-state renewables most likely impact
25 this system, just for clarity, again Cobb, 240

1 megawatts at least from Oregon. The PDCI line
2 intertie could put 250 to 500 megawatts on the
3 PDCI from northern Nevada and impact our system at
4 Sylmar. We believe that should be mentioned.

5 There's a six million dollar study going
6 forward funded by the CEC now for the muni's, but
7 that line is owned about 45 percent by SCE. So
8 any work done on the Pacific DC Intertie line to
9 provide an interconnect will impact the IOU's and
10 the muni's.

11 The other obvious interconnect point is
12 Nevada north of control as mentioned. There's a
13 question here about renewable energy credits. Our
14 company and others do not favor renewable energy
15 credits.

16 The question is how might that impact
17 the development of renewables in this state. We
18 believe it will do two things that are not good
19 for renewables, and not good for California.

20 The first thing is we believe it will
21 favor wind and will not deal with the quality
22 issue of the power -- the firmness, the baseload
23 power versus intermitteds. We believe that the
24 experience in Texas has been adverse to the
25 renewables industry.

1 The price of renewable credits are at
2 half a penny or less, and we don't believe that
3 reflects in any way the true attributes and
4 benefits of renewables.

5 We favor a program that we have
6 testified to in numerous proceedings, under which
7 the attributes could be sold, and could benefit
8 the system. One of the major benefits is that
9 these attributes, as regional and national gas
10 offset emission trading markets open up, as
11 they're starting to do now, those attributes,
12 those gas emission credits could be sold.

13 And part of that money, maybe all the
14 money, could cycle back to the PGC, to the Public
15 Goods Charge. And that could bring more
16 renewables online over time. We ask that you at
17 least consider this possibility.

18 That issue relates to question number
19 five, market price reference. We hope during the
20 hearings that are going to be held in the future
21 that we are able to represent the true cost of
22 natural gas in the market price reference
23 model. Because it's very important -- if
24 we don't have a reasonable market price referent
25 base price before the public goods charge is

1 attached on top, we won't have enough public goods
2 charge to meet the goals of the RPS. A very,
3 very, important issue.

4 We ask that we all bear in mind that
5 there are risks, and that we appear to have
6 reached a new plateau in natural gas prices on
7 average basis going forward in North America. A
8 very serious issue, and it could derail the entire
9 RPS process.

10 With respect to dates for -- I'm now
11 dealing with question number three, quantity and
12 technology dates -- I have some suggested changes.
13 We would like to see in your chart on page 31,
14 that deals with scenario by physical location by
15 megawatt.

16 We would suggest you add in the PG&E
17 sector Shasta County, with 90 megawatts by 2008,
18 another 150 by '17. We would suggest that you
19 might add Cobb as a marker for power for Oregon.
20 Put 60 megawatts under '05, 90 megawatts under
21 '08, and another 90 under '17.

22 We would suggest under SCE we would have
23 some marker for that power coming in north of
24 Mammoth from Nevada, the 300 megawatts. That
25 would show 60 megawatts in '05, 120 in '08,

1 another 120 by '17.

2 We would also suggest that you move Mono
3 up, and show 60 megawatts in '05, 120 in '08.
4 With respect to other technologies, that's an
5 open-ended question for us. I tried to put a
6 thinking cap on this morning.

7 You might consider what zero-emission
8 hydrogen fuels will do to the transmission grid
9 and the growth of renewable power in the state.
10 And if there's a significant growth of the
11 hydrogen market -- particularly in the air
12 polluted urban areas.

13 The most likely model seems to be rural
14 renewables that produce electricity, which is
15 moved by grid to the service stations in urban
16 areas. That could provide additional development
17 of thousands of megawatts in renewables in this
18 state. Thank you very much for allowing me to
19 speak again.

20 MR. TUTT: Thank you, Steve. Yes, sir?

21 MR. KONWINSKI: Good morning. Dave
22 Konwinski with Onsite Power Systems. Morning,
23 Commissioners and staff. I'd like to echo
24 everyone's comments on how great a report this is,
25 how well put together.

1 Two quick comments. The distributive
2 issue -- I think, like everyone's stating, we
3 should address a little bit more because of the
4 transmission constraints. We are primarily
5 interested in anaerobic digested technologies.

6 Very easily sitable, easily distributed.
7 They can go to strategic locations. And the
8 amount of biomass available is, I think, greatly
9 understated for the potential of energy that can
10 be produced.

11 California's Waste Management Board
12 states 15 million tons a year biomass still going
13 to landfills that could be utilized. L.A. Basin
14 has enough green waste collected curbside still
15 going to landfills, which -- about 70 megawatts of
16 power that could be sited.

17 And we put most of our comments in
18 writing for you to review, but we feel as though
19 there are two points that should be addressed a
20 little bit closer, especially for the transmission
21 constraints. Thank you.

22 MR. TUTT: Thank you.

23 CHAIRMAN KEESE: May I ask you a
24 question?

25 MR. TUTT: Yes.

1 CHAIRMAN KEESE: In moving towards a
2 renewable portfolio standard, the governor adopted
3 the standard of doubling basically, from 10
4 percent to 20 percent by the year 2017. And then
5 the legislature adopted the same structure.

6 And then the Action Plan suggested that
7 we would do our best to accelerate it to 2010. Is
8 it best we deal with that later this afternoon? I
9 haven't heard anybody comment on the realistic
10 nature of any of those terms.

11 MR. TUTT: I think we can do that later
12 this afternoon. This part was focused on 2005 and
13 2008, and the renewable resource development
14 report will I think go further, and look at the --

15 CHAIRMAN KEESE: Can we talk a little
16 bit about that this afternoon?

17 MR. TUTT: Sure.

18 CHAIRMAN KEESE: Thank you.

19 MR. TUTT: Okay. Gary?

20 MR. ALLEN: Chairman, Commissioners, Tim
21 and Drake. I felt the need to at least have a few
22 comments this morning, based on all of the other
23 discussions that have been occurring. I think
24 Drake and his staff have done a good job of
25 putting together a first cut on the report.

1 And I guess the sense that I'm having is
2 that we at Edison are trying to maintain some
3 consideration that the ratepayers need to be
4 considered at the forefront of whatever we do in
5 the RPS standard. They will be burdened with
6 whatever costs are set forth here.

7 Essentially, the ratepayers of
8 California have recently been burdened with a 30-
9 something billion dollar deficit, as well as the
10 ongoing costs of the CDWR contracts. My concern
11 is that the plausible scenario that you raised,
12 Drake, is illustrative of what is possible at any
13 cost.

14 Not necessarily what can be funded by
15 the existing PGC accounts. And transmission is
16 going to be on top of these funds as well. And
17 this leads into my next subject item, which I
18 think Commissioner Geesman you have focused on.

19 For the longest time -- and I've been in this
20 area longer than I care to think about now, about
21 20 years -- we have been tasked by the PUC to
22 ensure ratepayers are getting a fair value or fair
23 benefit out of the existing contracts.

24 I'm perhaps not the best person at
25 Edison to discuss the repowering, but briefly it

1 is a ratepayer issue that we're trying to protect.
2 And I know that there are tremendous disagreements
3 between us and the wind industry, and it is the
4 ratepayers that we are trying to maintain at the
5 forefront in that area.

6 Gregg Morris mentioned that he thought
7 the baseline values were a little overstated.
8 Well, I'll be here to counter that. I think the
9 baseline values -- at least as far as Edison is
10 concerned -- is somewhat understated.

11 And I would like to work with Drake to
12 try to deal with those issues. And clearly the
13 Commission has set forth, the CPUC has set forth,
14 in their recent decision on RPS, a tremendous
15 amount of work that needs to be undertaken in
16 terms of price reference and etc.

17 So we will be in there discussing these
18 issues with all of the individuals. And so that
19 still remains an unanswered question about where
20 the market price reference will be, where that
21 will go. So that's somewhat premature to go too
22 far into that. Thank you for your time.

23 COMMISSIONER GEESMAN: Let me ask you.
24 I don't disagree with your comments from a
25 ratepayer perspective, and certainly the way in

1 which our staff and the PUC staff have attempted
2 to approach this implementation of SB 1078 I think
3 is quite ratepayer oriented.

4 You've got a market price referent, and
5 anything above that referent that the utilities
6 would be expected to pay would come from the
7 public goods charge. And it's my understanding
8 that that particular structure was something that
9 your company was quite influential in having
10 written into the bill last year, in order to
11 assure that this was a ratepayer friendly program.

12 And I think that you were well-motivated
13 to do that. What perplexes me is, with respect to
14 this repowering question on wind sites -- and I
15 don't want to revisit all of the historical stuff,
16 i don't particularly see that as relevant with
17 Congress now taking up really a new bill -- why
18 doesn't it make sense, from the ratepayers
19 standpoint, to make those repowered sites
20 available for the production tax credit?

21 MR. ALLEN: My response to that is it
22 all depends on how you interrelate the repowered
23 production, with respect to the existing contract.

24 COMMISSIONER GEESMAN: So it's a PURPA
25 related --?

1 MR. ALLEN: That's right.

2 COMMISSIONER GEESMAN: That's helpful.

3 But I would ask you to take back to your company
4 my interest in pursuing this further and higher
5 up, so I have a better understanding as to how the
6 management of the company addresses this in the
7 next context of a Senate energy bill in front of
8 Congress now.

9 I think it's very important in terms of
10 bolstering the RPS program. As I've said before
11 in a number of different forums, we are not going
12 to achieve these goals without the leadership of
13 your company. It's been very helpful in the past.
14 I certainly anticipate it will be even more
15 helpful in the future.

16 MR. ALLEN: Just as a very -- I'm not
17 trying to be flip response. If you look at
18 Drake's table, Appendix A. And you look at the
19 percentages that Drake has included on his chart.
20 Our company is at the forefront.

21 COMMISSIONER GEESMAN: And I've circled
22 those numbers in fact. Because, you know, a lot
23 of the places I go around I get the impression
24 that your company's renewable efforts are headed
25 by Darth Vader. I don't subscribe to that at all.

1 I think you've done a great job. And
2 I'm sincere in saying that your leadership is
3 going to be necessary for us to accomplish this.
4 And I know at the highest levels of your company
5 there's a real commitment to do that. And I
6 appreciate that.

7 MR. ALLEN: And we remain committed.

8 CHAIRMAN KEESE: I heard we're going to
9 save debate on the timeframe until later. Has
10 your company looked at whether we can achieve the
11 Renewable Portfolio Standards goals by 2010?
12 Do you have -- are you going to be able to answer
13 that question?

14 MR. ALLEN: I'm going to try and hedge
15 as much as I can.

16 CHAIRMAN KEESE: You can hedge now or
17 later.

18 MR. ALLEN: We believe we're
19 substantially along the path already. But I
20 haven't looked at it, as far as the state is
21 concerned. So, I think, we have no problem
22 achieving that.

23 MR. TUTT: Yes, Todd?

24 MR. O'CONNOR: Good afternoon. Todd
25 O'Connor of Solargenix. And I just want to

1 address a specific question in your proposal.

2 Question five has to do with the market price
3 referent, and I heard Commissioner Geesman talk
4 about the market price reference.

5 I think it's important to understand
6 that the development scenario that you propose in
7 the preliminary draft is not accounting for the
8 IOU's coming out with their proposals by product.

9 There's going to be several price
10 referents, not just one. There will be one for
11 baseload, there will be one for peaking, there
12 will be one for as available, and dispatchable.
13 And then again, that's to determine the amount, if
14 any, of PGC funds will go to supplement the
15 contract.

16 And for this preliminary report to be
17 harmonized or integrated with the PUC decision I
18 think there has to be some sort of formatting done
19 to the report to recognize that scenario in play.
20 That's all I have to say. Thank you.

21 MR. TUTT: Tom?

22 MR. TANTON: I'm still Tom Tanton. One
23 response to a comment made earlier with respect to
24 comparative cost of central station be appended.

25 I think that's a good idea, but with a caution. I

1 fear that it may damn because of the fallacy of
2 composition, either innovative developers within a
3 region, or specifically cost-effective regions.

4 The report that sort of presumes a
5 generic cost for the various technologies, and as
6 we know, renewables are perhaps the most diverse
7 in cost by region and developer. One of your
8 specific questions had to do with the barriers to
9 development.

10 With a bit of institutional memory here,
11 I would refer you to the constraints mapping study
12 that was done a number of times a few years back
13 that identifies things like national forests,
14 tribal lands, etc.

15 Take out the transmission constraints,
16 because the purpose of the report is to figure out
17 where those are. And maybe update it with some
18 local concerns on land use, such as in Alameda
19 County and what not.

20 But that's a very ripe report to also
21 refer to.

22 MR. TUTT: Okay. Thank you. Yes, sir?

23 MR. GALLEBERG: Commissioners and staff,
24 my name is Johan Galleberg. I'm with California
25 ISO. I'm a grid planning engineer. I would just

1 like to say two things.

2 First of all, I would like to commend
3 the staff and Drake Johnson in particular for
4 putting together a very good report. The second
5 thing is just announce that the ISO will be
6 hosting a transmission plan stakeholder meeting on
7 July 7th at 10:00 at the ISO's location in Folsom.
8 Study plans will be presented at that meeting.

9 MR. TUTT: Anybody else want to talk
10 about the preliminary renewable resource
11 assessment this morning, this afternoon? I
12 suggest we break for lunch, and what time do you
13 want to come back? 1:30, 2:00?

14 CHAIRMAN BOYD: 1:30.

15 MR. TUTT: 1:30.

16 (Off the record.)

17 CHAIRMAN BOYD: We will reconvene.

18 MR. TUTT: That sounds good. There's
19 probably a bunch of people standing out in the
20 lobby there, but they'll come in. The second item
21 on our agenda today is the renewable resource
22 development report.

23 This is the report that's required by SB
24 1038 to be delivered to the legislature by the end
25 of the year, or earlier than than. Pam Doughman

1 is going to be providing the staff presentation on
2 the renewable resource development report.

3 This report will be based on the
4 preliminary renewable resource assessment, include
5 a significant amount of updates and expansions,
6 and be integrated and tied to the IEPR/PIES
7 report. Pam?

8 MS DOUGHMAN: Okay. For this section of
9 the workshop we're going to actually have two
10 speakers. I'll give you an overview of the
11 renewable resource development report, and then
12 George Simons from the PIER Renewables Program
13 will talk about some work that he has underway.

14 Let's see -- I'm supposed to change the
15 blinds. Okay? So my name is Pamela Doughman, I
16 work for the Renewable Energy Program.

17 And I'm going to talk briefly about the
18 legislative requirements, the topics that we're
19 planning to cover in the renewable resource
20 development report, a schedule, and then I'll go
21 over the questions and then we'll move over to
22 George. And then we'll open it up for a
23 discussion.

24 Okay, the legislative requirements. SB
25 1038 requires the Energy Commission to prepare and

1 submit a renewable resource assessment to the
2 legislature by December 1st.

3 SB 1389 requires an Integrated Energy
4 Policy Report every two years, to be submitted to
5 the Legislature on November 1st. That'll be the
6 first go around. And the renewable resource
7 development report will be a technical appendix to
8 the Public Interest Energy Strategies Report,
9 which is a volume of the Integrated Energy Policy
10 Report.

11 And we are combining these, linking
12 them, in order to facilitate integration of the
13 various issues. Here are the key themes that we
14 are planning to address in the renewable resource
15 development report.

16 First we're planning to give a brief
17 history of policy on renewables. Then talk about
18 the renewable portfolio standard, and recent
19 decisions as to how that will be implemented.

20 Then we will include, discuss, and update the
21 preliminary renewable resource assessment. We'll
22 update the data, including economic potential.
23 And we will include a plausible scenario for out-
24 of-state renewables. We will include
25 international members of the WECC, and potential

1 resources located in those areas. We
2 will include a discussion of the accelerated RPS
3 scenario, the 20 percent by 2010 that is included
4 in the Energy Action Plan. And we will discuss
5 benefits and barriers to development of renewable
6 resources to meet RPS, or the accelerated RPS.

7 We will also discuss research on
8 renewables. This provides an overview of the
9 schedule of development of the Renewable
10 Development Resource Report.

11 Today the goal is to gather input, and
12 on July 25th we will have a staff draft available
13 of the PIES report. And this will include a
14 summary of expected themes and data that will
15 become available in the RRDR.

16 August 13th, we'll have a committee
17 hearing on the PIES Report. September 30th, the
18 technical appendix, the actual RRDR, will be
19 available for public review. October 22nd, the
20 PIES Report will be adopted at a business meeting,
21 and October 31st the report will be sent to the
22 legislature.

23 Okay, now these are the questions that
24 were included in the workshop notice. And after
25 you hear George's presentation we open it up for

1 discussion. If you could focus your comments on
2 the accelerated scenario in particular that would
3 be very helpful.

4 The first question, to what extent have
5 renewable technologies been incorporated into
6 state and local security plans? What are the
7 benefits and barriers to expanding this
8 application of renewables?

9 The second question, what can be done to
10 increase the contribution of renewable energy
11 toward mitigating the effects of energy price
12 volatility and price shocks? Which measures
13 provide the benefit balance between benefits,
14 cost, economic efficiency, and equity?

15 The third question, what are the impacts
16 of renewable energy on California's electricity
17 and natural gas system in relation to the
18 provision of reliable and affordable energy?

19 The fourth question, on the next page,
20 what are the environmental impacts on public
21 health effects of a major increase in renewable
22 electricity generation technologies? Either the
23 RPS scenario or the accelerated scenario.

24 And question five, what are the R&D
25 projects that are currently being conducted

1 related to renewable energy? And which of these
2 efforts look promising in the near term or the
3 longer term? is there research that is needed to
4 further development the renewable energy markets,
5 and what are these research needs?

6 So that just provides a brief overview
7 of the Renewable Resource Development Report that
8 we will be working on for the next couple of
9 months here, and we welcome you input. But first,
10 let me pass it over to George Simons.

11 MR. SIMONS: Good afternoon. This
12 morning there were quite a few comments about the
13 accuracy of renewable resource assessments. Some
14 comments about utility load and peak demand. And
15 some of the research work that we've been doing,
16 some of the analysis that we've been doing, will
17 hopefully answer some of those questions.

18 And this really started off as a project
19 that didn't have anything really to do with the
20 renewable portfolio standard. It started as a
21 project so that we could target research and
22 development in the PIER renewables area.

23 And it has evolved into a project that
24 we think will be helpful for the RPS. Again, it
25 was geared towards trying to figure out how to

1 strategically target the development and
2 deployment of renewables in California that would
3 help provide benefits to the electricity system as
4 well as high public benefits, or non-energy
5 benefits.

6 We looked at grid reliability. We're
7 packaging this material into a geographic
8 information system developed by Department of
9 Forestry. We do resource assessments to evaluate
10 the location and the quantities of the renewables,
11 the quality of the renewables.

12 And then we also overlay demographic and
13 environmental information. What we do is we look
14 at a series of powerflow simulations for the state
15 from 2003 to 2017 to identify hotspots, whether
16 those are congestion or capacity hotspots.

17 The datasets that we develop again are
18 the renewable resource locations in the state, and
19 the magnitudes, demographics. We combine that
20 with economic and technical performance data,
21 looking at renewables and then the competition to
22 renewables -- whether that's a T&D upgrade, a
23 reconducing, or a fossil contribution.

24 We saw the hotspots by penetration
25 studies and the powerflows generically, so that we

1 can come up with a solution that isn't driven
2 necessarily by any particular perspective, whether
3 that's renewable or fossil or whatever.

4 But then we back in to comparing the
5 economics and the performance of renewables
6 against those generic solutions, to see how well
7 they fit. That was how we framed the question of
8 how do we target research and development of
9 renewables for California in the future.

10 And this is simply an overlay of how you
11 would look at that, with the powerflow studies up
12 at the top, going down into putting them as
13 hotspots into a map, a GIS layer, looking at the
14 solutions and overlaying those with what we call
15 different thematic layers of the public benefits
16 as well as the locations of the renewables.

17 So along the way we had to update some
18 of the renewable assessments that were done for
19 the state. For example, the last renewable
20 assessment for wind in California was done back in
21 the mid-1980's. It was very difficult to work
22 with that, because it wasn't really an electronic
23 format.

24 It also wasn't very precise, in terms of
25 location. It was also based on anemometer studies

1 that were at about 30 feet. That was the status
2 of the technology back in the 1980's.

3 We recognize that the turbine technology
4 had advanced, so the resource assessment that was
5 done is based on a predictive model that was done
6 by a company called Truewind, based on what's
7 called Mesomap.

8 They looked at wind power and wind
9 speeds at 30 meters, 50 meters, 70 meters, and 100
10 meters. What that has done -- and that's on a 200
11 by 200 meter grid. So we literally have a
12 database of wind potential in this state that has
13 about a billion points in it.

14 So it gives us a lot of accuracy
15 relative to location of wind quality. We're also
16 updating our assessments on solar, biomass, hydro
17 and small hydro in particular in ocean. Solar and
18 biomass are underway, small hydro is pending.
19 Just to give you some examples of how these things
20 are beginning to look.

21 There was some discussion this morning
22 about concentrated solar. Well, if you look at
23 the map on the right what you see in fact is there
24 are very specific locations in California where
25 you could use concentrating solar versus if you're

1 talking about something like flat plate solar,
2 that's the map on the left.

3 It's much more widely available, much
4 more dispersed resource. Similarly, we
5 subcontracted out through various avenues for
6 additional resource assessments. One of the
7 comments that we saw in was that people were
8 curious about new, or relatively new, geothermal
9 information for California.

10 Geothermex is a subcontractor to Hetch
11 Hetchy, who we have a large contract with. And
12 they've been updating the geothermal resources in
13 California, as well as the adjacent states. This
14 is a very refined analysis, so they're looking at
15 developed as well as undeveloped resources, and
16 coming up with potential costs for those
17 resources.

18 So one of the questions this morning was
19 are there going to be supply curves that are going
20 to be developed. Well, yes, you'll be able to get
21 relatively good supply curves out of information
22 like this.

23 Our powerflow simulations. The
24 powerflow simulations are very extensive. They're
25 done at one line diagram approach, so it's from a

1 bottoms up. The company doing that is Davis Power
2 Consulting, using a powerful model called Power
3 World.

4 They're working internally with
5 Commission transmission planners, the electricity
6 analysis office. What they're doing is merging
7 all the cases from the IOU's as well as the cases
8 from the muni's to get a single case for the
9 entire state.

10 And then they build around that based on
11 projected load from 2003 through 2017. 2005, for
12 example, represents about 6,000 simulations. The
13 results we have to date take us through 2007, so
14 we still have 2009 out to 2017.

15 I want to spend just a minute on the map
16 here. Some relatively interesting results that
17 we're discovering is that California has both
18 capacity and congestion problems.

19 Up in the far northern part of the state
20 -- wherever you see those red spots -- is an area
21 where, if you happen to, you really need to add
22 capacity at that point.

23 The blue spots represent congestion
24 zones, where if in fact you add capacity you make
25 the problem worse. This obviously changes. We've

1 done this at the 500 kilovolt level all the way
2 down to the 69 KV level.

3 It changes depending on the voltage
4 you're at, but it also changes as you go out in
5 time. The powerflows, I mentioned that we're
6 coordinating this work internally, they're being
7 reviewed internally.

8 We still need to integrate the out-of-
9 state transmission studies through a programmatic
10 contract that we have with Hetch Hetchy. A firm
11 called Electronix is looking at the transmission
12 corridors outside California and leading in and
13 what in fact are the transmission constraints and
14 what are our options.

15 We're also taking this -- there were
16 several comments about distributive generation.
17 Well, we're also going down below the 69 KV level,
18 all the way down to 12 KV. We can't do that for
19 the entire state because the datasets would be
20 just too huge to run.

21 So we're picking about six different
22 areas throughout the state to do case studies at
23 the 12 KV level, and look at penetration studies
24 of distributive generation renewables.

25 Again, I want to show you how some of

1 the GIS information works in conjunction with the
2 power flows. So for example, here's our wind
3 power map that we have of power densities. You
4 can then overlay that transmission distribution
5 system in a thematic layer.

6 And then on top of that you can also
7 begin to look at these hotspots, and you can begin
8 to say, okay, where's our potential? Now, our
9 potentials by the way don't just look at gross
10 potential. We have gross potential.

11 We're in the process of developing
12 thematic layers that will give us very specific
13 locational values of technical and economic
14 potentials.

15 So some of the things that people
16 mentioned today about are you going to try and
17 develop renewables on sacred lands, for example,
18 or in pristine areas. That's part of what would
19 get filtered out in a technical potential.

20 And again just to show you how we can
21 use some of this information. We're looking just
22 at Forestry at this particular point in time.
23 That's the green resource area throughout the
24 state.

25 This comes from some very extensive data

1 that Department of Forestry has developed that
2 takes the information all the way down to the
3 species level and puts it on an acreage basis.

4 The red triangles represent existing
5 solid fuel biomass plants in California. You can
6 then turn around and look at these relative to
7 what are high wildfire risk areas in the state.

8 Again, if you're looking at what areas
9 do you replot renewables first in, you're talking
10 about forestry residues, one of the things you
11 might want to consider is can we actually harvest
12 in areas such that we would reduce wildfire
13 impacts?

14 And lastly, again, you can take and
15 overlay any number of datasets on top of this.
16 And so what we will have as we develop this report
17 for inclusion into the Renewable Development
18 Report is literally hundreds of thematic layers.

19 It's really -- thematic layers represent
20 nothing more than data manipulation with a
21 geographical information system.

22 I want to talk a little bit about the
23 transmission corridor work that's being done by
24 Electronix. This just gives some example of the
25 type of analyses that they're doing.

1 They're literally looking at what are
2 the transmission corridors? What are the
3 capacities? What can come in from outside the
4 state?

5 Again, under the Hetch Hetchy contract
6 we're looking at geothermal, wind, and biomass, as
7 well as some solar resources along the Pacific,
8 Sierra Pacific high-voltage DC line. And so the
9 studies are really showing that there are
10 constraints but there are also some very large
11 opportunities.

12 And again, this is just some example of
13 the types of options that we're considering. This
14 is just one of the, two of the case studies --
15 manifestation of the case studies being looked at
16 through Davis Power Consulting down at the
17 distributed generation level.

18 And again, what you do is you begin to
19 do penetration studies into what are the hotspots
20 at the local level.

21 I want to talk about the strategic
22 values analysis report. Tim provided me an
23 outline for the renewable development report, and
24 I thought that it would be wise of us to try and
25 structure the strategic value analysis report

1 along the same lines.

2 So that information developed in the SBA
3 report could be pulled out for use in the
4 developing report. So we're going to look at the
5 electricity situation -- transmission constraints,
6 capacity constraints, as well as peak demand
7 issues.

8 We're going to look at different
9 scenarios. With the powerflow models we can
10 actually take the straight line approach and look
11 at what that means relative to the electricity
12 system. The strategic value analysis itself lends
13 to solving for electricity problems.

14 And then we can also look at bulk
15 renewables only. We're doing quite a bit of work
16 at looking at what's the status of technologies,
17 what's the development potential for renewable
18 technologies both on a performance basis --
19 whether that's efficiency or capacity -- and also
20 what are the economics.

21 What are the environmental constraints
22 or what's the environmental performance. So we
23 will have chapters in our report that look
24 specifically at each of the renewable
25 resources. Their cost, their technical

1 performance, the amount of resource, both on a
2 gross, technical, and economic potential, and
3 where those are located.

4 And then we'll also dovetail that with
5 renewable research efforts that are being
6 developed both within the Commission as well as
7 outside the Commission. And I don't know how you
8 want to handle -- questions now? Or just shift
9 over to --?

10 MR. TUTT: Yes, I think questions now.
11 If there are any questions related to what we had
12 about the renewable resource development report
13 the questions that were in the agenda notice or
14 the workshop notice or questions on George's or
15 Pam's presentation, feel free to come up and state
16 your question or your comment?

17 MR. SIMONS: And I will be talking about
18 renewable research technologies in a second
19 presentation on global climate change.

20 MR. TUTT: Yes, Mark.

21 MR. SKOWRONSKI: Mark Skowronski,
22 Solargenix. Is this online? I'd like to have a
23 copy of the report.

24 MR. TUTT: This is a pending or
25 developing report. It's not online yet. It's

1 something that will be part of or connected to the
2 renewable resource development report that comes
3 over the course of the next four or five months.

4 MR. SKOWRONSKI: But his presentation.
5 Can we have a copy of his presentation?

6 MR. SIMONS: I didn't make any copies,
7 but we'll put it up on the website.

8 MR. SKOWRONSKI: Thanks, George.

9 MS. TURNBULL: Jane Turnbull. I'm
10 excited. I think that's a beautiful piece of
11 work. As an ex-researcher and GIS fan, it's
12 really thrilling.

13 But I guess the one question I'd like to
14 ask is that you mentioned that you're assessing
15 the public benefits, and I wondered how that is
16 being done.

17 MR. SIMONS: We intend to look at
18 environmental characteristics throughout the state
19 as well as demographics with respect to poverty
20 and unemployment. We're going to be looking at
21 things like air quality.

22 And each of those -- we will value those
23 from some relative basis within what we call a
24 thematic layer. We'll build up all of those, so
25 that as we see a deployment of renewables, where

1 there's a lot of renewables that can help solve
2 the electricity problem, then it's also does it
3 help solve public benefit, or does it address
4 public benefit issues.

5 And -- I didn't know, is that answering
6 what your question was, or did you specifically
7 want to know what --?

8 MS. TURNBULL: That's a big answer, but
9 are there precedents for doing this?

10 MR. SIMONS: Can we do this? I don't
11 know. It's a lot to bite off, but --.

12 COMMISSIONER KEESE: Yes, we have a
13 transcript here. Maybe we should be on a
14 microphone if we're going to go back and forth.

15 MS. TURNBULL: I don't have any more,
16 but you know, are there precedents?

17 MR. SIMONS: Well, I --

18 MR. TUTT: The question from the
19 audience was are there precedents to doing this
20 kind of analysis, and Ms. Griffin, of our
21 Electricity Analysis Office?

22 MS. GRIFFIN: No more. I'm the program
23 manager for the Integrated Energy Policy Report.
24 And the precedent is actually going to be
25 presented at the environmental performance

1 workshop.

2 Coming out today is our second
3 environmental performance report, which talks
4 about the environmental impacts of all types of
5 central station generation including
6 renewables. So there are long sections in
7 there on geothermal and wind, as well as the
8 conventional central station, where they look at
9 the impacts on biology, soils, EJ, all of those
10 kinds of things. We've got -- through our
11 siting program -- a fairly well-developed on the
12 environmental and local community impact
13 methodology, which can be adapted and developed
14 and expanded by the work that George's group is
15 doing.

16 MS. TURNBULL: Can I ask just a followup
17 question? Are you actually assigning costs to
18 that, or are you just looking at the environmental
19 attributes?

20 MS. GRIFFIN: Just the attributes. It's
21 not a cost assessment.

22 MS. HICKS: I'm excited about that too.
23 Will there be an opportunity to see a copy of the
24 draft and make comments as an organization?

25 CHAIRMAN KEESE: Did I hear that it was

1 coming out today?

2 MS. GRIFFIN: The environmental
3 performance report draft is being posted on the
4 web today, so all of you who are on the IEPR list
5 serve will get an automatic notification. And the
6 workshop for commenting on it, that public
7 workshop is July 11th.

8 CHAIRMAN KEESE: 11th is transportation.
9 Probably the 8th.

10 MS. GRIFFIN: Okay. So it must be the
11 8th. Municipal resources is the 10th, so July 8th
12 is the workshop for that. And that notice will
13 also be posted today, so you'll be getting an
14 automatic on that.

15 MS. HICKS: And that is acceptable for
16 us to send written comments?

17 MS. GRIFFIN: Yes, of course. To the
18 docket, the notice gives you the address to send
19 your written comments to the docket. And if you
20 do have written comments, please follow the
21 instructions and actually send them to the docket,
22 we then have a system for notifying everyone else.

23 There's a tendency to want to address it
24 to Tim or to one of the Commissioners, and then we
25 all have to run around and make sure that we've

1 gotten it officially into the docket and
2 officially available for everyone in the public.

3 So, we appreciate your help on that.

4 MR. TUTT: And I would add that the
5 Public Interest Energy Strategies report, the PIES
6 report, is also going to be available for public
7 review on July 25th. And the renewable resource
8 development report, which is an appendix to the
9 PIES report, will be available for public review
10 on September 30th.

11 So there's going to be many
12 opportunities for this information to be -- well,
13 we're going to be further developing it, and then
14 providing opportunities for the interested parties
15 and the public to comment on what we've done.
16 Okay, Todd?

17 MR. O'CONNOR: Again, this is Todd
18 O'Connor for Solargenix. And my question right
19 now is on process. If I understood your direction
20 correctly, before George gives another segment of
21 his presentation, is this a good time to address
22 some of the questions that were addressed in the
23 notice?

24 MR. TUTT: Absolutely, yes.

25 MR. O'CONNOR: Thank you. On your

1 section regarding integration of renewable
2 resources with the new electricity system,
3 question one, what are the benefits and barriers
4 to expanding this application of renewable energy?

5 Again, we're here to talk about
6 concentrated solar, I'm here and several others
7 are here to talk about concentrated solar power,
8 or in the old industry known as solar thermal.

9 We believe the benefits from looking at
10 concentrated solar power include improved system
11 performance and reduced operating costs. As
12 previously testified today, 354 megawatts of said
13 plants continue to operate successfully on the
14 power grid here in California.

15 Annual operative plans has increased by
16 35 percent. As plant operations have improved
17 over the last ten years and O&M costs have
18 correspondingly dropped by 40 percent. And these
19 plants have demonstrated the ability of CSP to
20 meet utility requirements.

21 Concentrated solar power products and
22 systems utilize many of the same technologies and
23 equipment used by conventional central station
24 power plants, simply substituting the concentrated
25 power of the sun for the combustion of fossil fuel

1 to provide the energy for conversion into
2 electricity.

3 This evolutionary aspect results in easy
4 integration in today's central station-based
5 electric utility grid. In terms of dispatchable
6 benefits, CSP plans for cost-effective storage or
7 natural gas hybridization can deliver power to the
8 utility grid when their power is most needed, not
9 just when the sun is shining.

10 The CSP plants peaking capacity
11 routinely approaches 100 percent. And the issue
12 in everybody's mind as we get into an RFP based on
13 a new portfolio standards is cost. And depending
14 on the needs of the utilities and their customers.
15 These existing CSP plants produce power now for as
16 low or maybe even lower now to 12 cents per
17 kilowatt hour, including both capital and
18 operating costs.

19 With projected costs as low as five
20 kilowatts per hour within ten years of technology
21 refinements. Economies of scale are implemented
22 as well as some of the financing being paid off up
23 front.

24 Independent assessments by the World
25 Bank, AB Little, EPRI and others have confirmed

1 these cost projections. Though not currently the
2 lowest cost for electricity, CSP's is already
3 close, and you've heard testimony today from Mr.
4 Skowronski to being competitive in peaking
5 markets.

6 And there is significant demand for
7 carbon-free electricity from green sources, even
8 at above market prices. It depends how the REC
9 program is going to be defined here in California.
10 There are several REC programs in the west where
11 CSP can provide value.

12 And then question two is what can be
13 done to increase the contribution of renewable
14 energy toward mitigating the effects of energy
15 price volatility and potential price shocks?

16 CSP, through continued research, can be
17 utilized in storage and hybridization applications
18 as I testified a few minutes ago, which can use
19 supplemental fossil fuel firing. And that
20 provides value in the dispatchable power markets.

21 CSP, either as a peaking product or in
22 tandem with a natural gas power plant, is capable
23 of mitigating the effect of natural gas price and
24 supply volatility, because you have a proven
25 technology out there that can provide peaking.

1 And that was a big problem a couple of
2 years ago as we all remember.

3 What are the environmental impacts and
4 public health effects of a major increase in
5 renewable electricity generation technology? CSP
6 plants produce no emissions during solar
7 electricity generation.

8 While hybrid plants like SEG's do bring
9 gas during hybrid operations for a maximum of 25
10 percent of their power, newer CSP technologies
11 incorporating storage have the same
12 dispatchability with no fossil fuel usage and zero
13 emissions.

14 And also there's ongoing research on how
15 to improve the emissions level of these 75
16 percent/25 percent power plants.

17 Is there any research and development
18 currently being conducted related to a renewable
19 energy that looks promising for the near term?
20 According to a Department of Energy study
21 conducted by Sargent & Lundy, the DOE has issued a
22 final report on their due diligence review of
23 power, tower and parabolic trough technologies.

24 And it's on the Sandia website. We've
25 provided in our comments. The report is entitled

1 "Assessment of Parabolic Trough and Power Tower
2 Solar Technology Cost and Performance Forecasts."

3 It's not the latest Harry Potter book,
4 but it is an important publication nonetheless.
5 The report finds that the two technologies have
6 significant potential for future cost reduction
7 and relatively modest appointment levels. The
8 main hurdle is the implementation of incentives
9 needed to buy down the initial non-cost
10 competitive plants.

11 In longer term, what are the resource
12 needs? Essentially, looking at the Department of
13 Energy program, we recommend that there are some
14 outreach to go on between DOE and CEC regarding
15 making CSP an integral part of the renewable solar
16 program.

17 Some of the relevant research needs, we
18 believe, have to do with system validation.
19 Number two, reduce levelized costs for
20 dispatchable and distributed applications, and
21 also look at some other DOE CSP programs.

22 One in particular is a cost-effective
23 high concentrator PV program, and there are
24 several companies within California who are
25 involved in that even as we speak.

1 With respect to solar/thermal and
2 Solargenix -- Solargenix, in conjunction with DOE,
3 was responsible for developing and testing and
4 deployment of residential and commercial solar
5 thermal, combining heat and power products
6 providing electric generation and heating and
7 cooling energy for buildings.

8 This work is being done with major air
9 conditioning companies like Carrier and Trane in
10 the air conditioning, heat engine and electric
11 generator industries.

12 Solargenix is part of major U.S.
13 universities conducting testing, R&D, and
14 commercialization of products driven by
15 solar/thermal technologies. The most significant
16 challenge in dispatchable applications is that the
17 levelized energy cost is currently higher than
18 competing conventional technologies.

19 We believe that the DOE program, through
20 technology enhancements, will help reduce the
21 capitol cost of solar components, enable higher
22 annual efficiency both leading to lower levelized
23 energy cost.

24 There are representatives from other
25 concentrated solar power companies here. One is

1 Boeing, Mike McDowell is in the audience. The
2 other is Bob Liden who you heard from earlier
3 today, and they can talk more about their
4 programs. But thank you for this opportunity to
5 talk about these programs.

6 MR. TUTT: Thank you, Todd. Steve?

7 MR. MUNSON: Steve Munson, Vulcan Power.
8 We all work hard to attempt to integrate these
9 multiple studies into a product which is a stable
10 grid and meeting the RPS objectives. My question
11 is for George.

12 May we -- you were here today, this
13 morning? May we assume that the constraint
14 removal studies that we talked about earlier will
15 be addressed in your study?

16 I'm specifically talking about north of
17 control, 300 megawatts, and north of cottonwood.
18 Your green and red dots on the map look very
19 similar to the type of preliminary discussions
20 we've had with the Cottonwood area, for example.

21 MR. SIMONS: Well, our report will, the
22 powerflow analyses that we're doing we're
23 coordinating with our transmission engineers and
24 our electricity analysis office. They actually
25 are the parties that would be responsible for all

1 transmission work.

2 We will feed the results that we get.

3 Our consultants use the assumptions and the
4 framework set up by those folks here within the
5 Commission. All of our assumptions, all of our
6 analyses will be available once the report comes
7 out, but it's really the other offices in the
8 Commission that have the ability on that.

9 MR. TUTT: And the Public Utilities
10 Commission as well. I presume that your
11 constraint analyses questions will be addressed in
12 one of those places, but we're not the right
13 people to answer the question, I don't think.

14 We're not doing the transmission planning,
15 we're doing the renewable resources development so
16 there can be a transmission plan.

17 CHAIRMAN KEESE: But the nature of the
18 report is an integrated report. And we're just
19 talking about a couple of segments here. You
20 can't discuss electricity without talking about
21 natural gas, and this is the first time we're
22 trying to not have an electricity report sitting
23 here and a natural gas report.

24 Integrate the whole thing. So as we go
25 through the IEPR process, integrated energy, we

1 will be trying our darndest to bring all of these
2 things together.

3 MR. MUNSON: May I feedback what I think
4 you said?

5 CHAIRMAN KEESE: Sure.

6 MR. MUNSON: Through these multiple
7 processes then, we would hope that the constraint
8 studies would surface and benefit from this system
9 work that is being done.

10 CHAIRMAN KEESE: When we make policy
11 recommendations that we -- clearly that's part of
12 our target.

13 CHAIRMAN BOYD: Let me take a try. Are
14 your constraints studies public or available to
15 us?

16 MR. MUNSON: That's a very good point,
17 thank you. We're going to make them available.

18 CHAIRMAN BOYD: Can you send me a letter
19 indicating that you have done that, or that you
20 will be doing that? And I'll make certain that it
21 gets to the right person in our transmission
22 staff.

23 MR. MUNSON: We would be delighted to do
24 that. Thank you.

25 MR. TUTT: Someone else? Looks like

1 we've covered the public comment on that part of
2 the agenda. And we can certainly move then, if
3 people are willing, to the third part of our
4 agenda, which is potential measures to reduce
5 greenhouse gas emissions with renewable energy.

6 And Pierre is going to start that part of the
7 agenda off. There is a list of questions again in
8 the notice to address your attention to these
9 issues. I think we have a few presentations that
10 I'll let Pierre introduce, and start that part of
11 the agenda now.

12 MR. DUVAIR: Good afternoon, everyone.
13 My name's Pierre duvair. I'm with the Climate
14 Change Program here at the California Energy
15 commission. We've got four speakers for this
16 session this afternoon, and I'm very delighted to
17 have all of them here.

18 And I'm just going to go ahead and
19 introduce our first speaker, who's going to be
20 Doug Wickizer from the California Department of
21 Forestry & Fire Protection. He's going to talk
22 about biomass in particular for resources in
23 biomass, and how they can relate to ways that the
24 state might reduce it's greenhouse gas emissions.

25 MR. WICKIZER: Good afternoon. I am

1 Doug Wickizer. I'm with the California Department
2 of Forestry & Fire Protection. I'm our Chief of
3 Environmental Protection and Regulations, and
4 within that happens to lie forest utilization,
5 which include biomass.

6 What I'll try to do is just give you a
7 quick overview of what our interest is, if I can
8 figure out how to do this. There we go. Our
9 initial interest in working with the Energy
10 Commission, and inform as many partnerships as we
11 could comes from two primary areas.

12 As you know, our agency is involved in
13 the resource protection for California. One of
14 the major issues that we face continually in
15 California is of fire protection, and hence the
16 biomass that we have out there in the wildland.

17 In dealing with our California national
18 fire plan, it's modeled after each other,
19 surprisingly, so they're consistent. Our
20 objectives are reducing the fuel near the homes,
21 providing better protection for the urban
22 interface areas where there's California
23 demographics change.

24 We are putting a lot more rural
25 development out there in the wildlands. As that

1 development encroaches we have a larger need to,
2 in our protection arena, to deal with wildland
3 wood waste. We've ended up defining that with the
4 Integrated Waste Management Board as we went along
5 through this.

6 So we have a need for disposal, and
7 treatment methods that we have right now are
8 burning broadcasts, landfills, open burning, and
9 some biomass to energy, which is an area where we
10 feel there is the greatest benefits.

11 In that we've worked with the Energy
12 Commission, as George had mentioned, and we've
13 gone a long ways in developing the different types
14 of analysis, we have done GIS-wise, to define what
15 the fire threat is in California.

16 As you can see, about 48 percent of the
17 state is at high and very high and extreme risk.
18 That's due to the ecology of the different systems
19 out there right now. There was a heavy timber
20 harvesting in the early 50's and the late 1800's
21 that converted the forest types in California more
22 from old growth to young growth, which gives you a
23 higher distribution of ladder fuels, higher risk.

24 Tonnage per acre probably comes out
25 close. We then took that a step further and took

1 it into fire-related ecosystem risks. I guess the
2 best current example of that is what's going on in
3 southern California around Lake Arrowhead and Big
4 Bear.

5 As you're aware, we have quite an effort
6 going on down there right now. 52,000 acres of 80
7 percent dead trees. I'll show you a picture of
8 that in a little bit. That's a lot of fuel that
9 can be converted to energy.

10 So it's an opportunity throughout the
11 state to me for us to learn how to better develop
12 the ability to transport and convert that biomass
13 waste into either energy, ethanol, or other minor
14 forest wood products.

15 The other part, real quickly, to me that
16 we're trying to gain out of this as a department
17 is somewhat of a economic revitalization of rural
18 economy to a certain degree. As you know, due to
19 our forest practice regulations, there are
20 different pressures on the land management of
21 private lands in California.

22 And shifts in management approaches by
23 the federal landowners, there's been a decrease in
24 the harvest amount in California. What used to be
25 a four to five billion board foot harvest a year

1 has dropped down to about two billion. There's a
2 similar decrease in the contribution to the
3 economy.

4 Hopefully, in working landscapes will
5 be, by pushing some value out of the close grown
6 material, the heavy fuel loading that we have out
7 there, we can end up adding to local economies
8 some. To me that's a big opportunity that we have
9 to look forward to as well.

10 We -- I'm sure you've heard all this
11 before, the difficulties in implementing the fuels
12 is the risk of damage to the homes if we use
13 prescribed fire in those areas. Very tight
14 burning prescriptions. We have air pollution from
15 open burning, and carbon dioxide and landfill
16 issues.

17 Opportunities for roughly -- if you take
18 the wood waste, forest, and chaparral, the
19 wildlands themselves -- it's about 34 percent of
20 the opportunity. Current forest biomass sources
21 in California -- we run 9 to 20 million acres in
22 chaparral. A lot of that, admittedly, would be
23 very hard to harvest due to steepness and
24 inaccessibility.

25 But we do have a lot of true forest

1 lands that are 14 to -- well, roughly 8 million
2 acres in private and 8 million acres in federal
3 ownerships. And you can see the tonnage per acre.
4 Opportunities for reduction. Where we see it is
5 in a couple of different areas.

6 And this is where climate starts to
7 blend into it. Timber harvest residues -- if
8 modification of harvesting and utilization methods
9 in harvesting processes, such as full tree
10 yarding, if we can get that material into the
11 landings and reduce the transportation cost and
12 provide some opportunity for biofuels or other
13 minor forest products.

14 The other thing -- that lower picture--
15 is just to give you an idea of what that Arrowhead
16 thing looks like down there. If you're
17 interested, it's on our website. You can pull up
18 the infrared, and you can see how climate effects
19 when we have a drought move in, how we have an
20 increase in insect population and mortality, and
21 then certainly increased public health and safety
22 risks that go with it.

23 Woody biomass supply and use -- there's
24 just a quick overview of some information. I
25 think the source was the boss on that one -- oh

1 no, Bruce Springsteen, okay.

2 Another map that we brought along worked
3 out with George and the Energy Commission is
4 conversion of live material to bone dry, kind of
5 the opportunities out there across the state by
6 densities. This work will be available in the
7 reports George is referring to.

8 The barriers that we see that are out
9 there yet from our perspective is transportation
10 is a big one, the efficiencies of the distributed
11 energy equipment that is available right now, and
12 then some of the institutional barriers of grid
13 access, privately-owned utility practices and
14 emission standards.

15 This panel went through it a little bit
16 earlier, but we have been on board with that all
17 along. And certainly support the concept of
18 renewable portfolio standard. The state of the
19 renewable energy goals right now is that the
20 governor has challenged higher education
21 institutions.

22 To me, there's a lot of money going into
23 rebuilding infrastructure in the state that would
24 seem to be a good opportunity not only for
25 efficiencies, but for further development of

1 renewables as we go along in restructuring.

2 We're trying to consider that. Most of
3 our fire stations are 50 years old. We've been
4 going through a major rebuilding process the last
5 ten years, the last decade or so.

6 Biomass energy capacity -- you know this
7 better than I -- it's about 685 megawatts. It's
8 in primarily now in somewhat centralized plants
9 that were developed under the incentives you've
10 provided in the past -- the Energy Commission.

11 We are trying to work towards something
12 we feel is an opportunity for our needs, and
13 that's the distributed generation smaller plants.
14 We're also trying to work along with the folks on
15 the ethanol as a gasoline offshoot unit, and some
16 opportunity for using woody cellulosic biomass,
17 which has somewhat of a greater life cycle benefit
18 than the corn and some of those other vegetative
19 opportunities.

20 Our specific effort, one that we've
21 worked with George and Val and then a lot of other
22 folks and haven't given up on yet, is we're trying
23 a project of our own specific nature at Washington
24 Bridge, one of our conservation camps.

25 Our effort is to work with this

1 partnership, which has been formed over a number
2 of years, to try and develop something specific
3 where we can end up quickly producing something
4 that's roughly ten to 11 percent energy through
5 indirect fire gas turbines.

6 Producing those values, using about 5
7 million BTU gasification system. We think that,
8 if we're successful that -- or whoever, we haven't
9 had anyone come forward with a better light bulb
10 yet, as far as something that can be installed on
11 renewables and use biomass out there in a
12 distributed sense.

13 So we're trying to work with as many
14 folks as we can to try and find out what that
15 might be. And if we can do that, then we have the
16 opportunity to start scattering biomass
17 utilization up and down the Sierra working in
18 conjunction with Waste Management and the Energy
19 Commission.

20 And a lot of the information that George
21 just gained out of our joint project. Problem, I
22 only put that one little corner down there just to
23 show you that, to me what we found and what the
24 joint agency climate team and working with Mr.
25 Boyd in the past on biomass to a degree, we've all

1 come up to the conclusion that our best
2 opportunity is a combination of ag, urban, and
3 wildland values, where we can distribute the
4 generation capacity where it can take advantage of
5 somewhat of a middle of the road economics on the
6 three.

7 Air emissions. Real quickly, the idea
8 on the top is that the biomass energy produces
9 less, has a lower coefficient for putting carbon
10 dioxide into the air then the other means of
11 disposing of forest waste.

12 We've used -- I think Mr. Morris is in
13 the audience today, he's helped us out with that
14 to make those determinations. Our conclusion is
15 it's bio energy or ashes out there, real simply.
16 There's a stand of trees that's been treated,
17 that's our ideal.

18 When you run a fire through it that's
19 the way the fire behaves once you treat a stand.
20 If you don't treat a stand in the lower corner is
21 a real small idea of how significant the effects
22 can be.

23 So I just wanted to put forth where we
24 see benefits coming out of this. It's certainly
25 air quality. The timing of the release -- every

1 acre in California is going to burn. It's just a
2 matter of when.

3 And it's the value you can get, it's how
4 severe, and if you can limit the effects of that
5 by reducing the amount of fuels and the intensity
6 of the fires that burn over it. So thank you very
7 much.

8 CHAIRMAN BOYD: Thank you, Doug. That's
9 a good slide show. You need to show that to more
10 audiences. We've been struggling with this for,
11 what -- four years -- you and I together.

12 MR. DUVAIR: Next I'd like to introduce
13 Matt Summers. He's going to speak to us about
14 opportunities to utilize biomass in the
15 agricultural sector in ways that might be able to
16 mitigate greenhouse gas emissions.

17 MR. SUMMERS: Good afternoon, everyone.
18 I've got a real brief presentation here, and sort
19 of going to fill in a sort of general outline that
20 I laid out. And I'm actually not just going to
21 talk about biomass, but all sorts of renewable
22 opportunities in agriculture.

23 And first, sort of historically,
24 agriculture has been a user of renewable energy.
25 And certainly in the history of agriculture,

1 humans and draft animals before modern times were
2 the main sources of energy. On agricultural
3 operation about a third of the crop was dedicated
4 to feeding draft animals.

5 So historically renewable energy has
6 been a part of the system. As time went on, you
7 can see down here, was a very early combine
8 developed in California. In fact, it's the first
9 mechanically driven combine, from Lindsay,
10 California.

11 And it was propelled by straw fuel that
12 went into a boiler and ran the combine. So
13 there's sort of this transition from a draft
14 animal to sort of a mechanized approach to
15 renewable energy. Certainly, solar energy for
16 crop drying is still a very common practice.

17 So renewable energy is a part of that
18 system still today. In fact, a lot of energy in
19 agriculture gets spent on drying crops, even
20 though several crops are dried out in the field.
21 And certainly wind energy has always been a part
22 of the system and might be able to be further
23 exploited at this point.

24 So what are today's renewable energy
25 opportunities for agriculture in our modern world?

1 First one, up in the right corner there, biomass
2 power production. And scattered throughout the
3 agricultural areas of the central valley we've got
4 these biomass power plants, which sort of are
5 either barely keeping running, you know, on the
6 price of power.

7 And some of them have shut down. And so
8 there's certainly some issues there. And
9 agriculture would like to see those facilities
10 stay open so that there's alternatives to open
11 burning for agricultural residues. Anaerobic
12 digesters, the centralized systems, are another
13 real good potential to be further exploited.

14 There's digesters at a lot of food
15 processing facilities, and there's a state program
16 to develop onsite systems for dairies as well.
17 And that's been a real success and hopefully the
18 results of that program will encourage more of
19 that in the future.

20 So onsite renewable generation. Of
21 course, agriculture occupies quite a bit of land
22 area, so certainly wind and PV systems have a real
23 potential in agriculture. Solar/thermal and solar
24 drying systems have a potential to be further
25 exploited.

1 And one I like to throw in there too is
2 nutrient management. A lot of energy that's used
3 for agriculture is tied up in fertilizers. And
4 the better we can use the nutrients that come
5 through that system is another way to provide
6 renewable energy.

7 Maybe not something traditionally people
8 think of because it doesn't involve a power cycle,
9 but it is a way to offset fossil energy in
10 agriculture.

11 So the benefits and renewables in
12 agriculture. The big one is stabilization and
13 disposal of waste materials. That's your biomass
14 and your anaerobic digester energy systems.
15 Possibly energy cost reduction.

16 So if you can displace part of your
17 retail cost for power you can, with a lot of
18 renewable systems you can take advantage of that
19 and have a reasonable payback period for your
20 system.

21 Possible reductions in pollutant
22 emissions. If you're talking about open burning,
23 and you're instead going to run that crop residue
24 through a power plant you're certainly going to
25 offset some emissions, and the same potential for

1 manure digesters as well to offset some of the
2 emissions that would come from other types of
3 handling the manure.

4 Reduction in greenhouse gas emissions.
5 Most of the life cycle analysis shows that biomass
6 power is certainly a positive in terms of
7 greenhouse gas emissions. And in terms of rural
8 economic development, like Doug said earlier,
9 that's a real important factor with our rural
10 areas suffering from high unemployment rates and
11 this type of thing.

12 If we could produce energy in those
13 areas that'll keep jobs here in California, and
14 rural jobs which are real necessary. Key
15 challenges to renewables and agriculture. First
16 of all, it's the cost of energy. If the system
17 cost is higher than other types of energy sources
18 then that's a real challenge we've got to
19 overcome.

20 And certainly if there's other public
21 benefits it's something we should consider in the
22 equation. Capitol costs of the systems is always
23 a big barrier, particularly for onsite power
24 systems, is getting someone to put forward the
25 upfront cost of the system is a key constraint.

1 Interconnection for distributor
2 generation. Once again, most of these, like a
3 dairy facility or other facility that's
4 considering their own power system, they are going
5 to need interconnection for reliability.

6 So that's a key part of the equation,
7 and there's certainly some need to address that
8 issue. System reliability and maintenance and
9 part of the issue is there's not always good
10 information on the longevity of these systems and
11 what it's really going to take to maintain the
12 systems.

13 And that kind of data -- you know, the
14 state or other agencies supporting developing that
15 kind of data I think is real important. And
16 regional regulatory requirements can be a
17 challenge for these systems.

18 So some of the policy priorities coming
19 from these challenges would be long-term markets
20 for agricultural biomass. That's a key issue,
21 particularly in the San Joaquin, where they're
22 facing burning phasedowns as the rice industry had
23 to deal with in the upper part of the Sacramento
24 Valley.

25 A key thing is going to be shore up

1 markets for agriculture biomass. Incentives for
2 renewable usage is another way, it kind of ties
3 into the first one -- is a way to make renewables
4 a viable alternative.

5 Fair interconnection and rate policies.
6 That's going to be really key here. We're seeing
7 that with the state SP5X program. It's getting a
8 policy that can help interconnection happen, and a
9 rate policy that makes that sort of a viable
10 alternative to an onsite power provider.

11 Other regulatory barriers. Some
12 certainly should be n place and shouldn't be
13 removed. I've kind of changed my language here a
14 little bit, but there are some barriers that are
15 artificial at a regional level, and a lot of them
16 stem from there not being a lot of knowledge at a
17 local level on how these systems work and what the
18 impact is going to be.

19 And certainly things like the California
20 Environmental Quality Act and those sorts of
21 things can sometimes be a barrier to adopting new
22 systems. System reliability testing and new
23 technology development, as I discussed earlier,
24 are key factors as well on the policy level.

25 And I'm going to leave it at that, and

1 this is my contact information. Thank you.

2 MR. DUVAIR: Thank you, Matt. I'd just
3 like everyone to know we do have presentations.
4 These slides are out on the front table from the
5 first three speakers, and we'll have all the
6 presentation up on the IEPR website under the
7 renewables section.

8 Our next speaker is Doug Grandy, from
9 the Department of General Services.

10 MR. GRANDY: Okay, as Pierre said, I'm
11 with the Department of General Services. I spent
12 about 20 years over there running a group that did
13 energy project development in state facilities,
14 and the last couple of years I've been loaned out
15 to the governor's office of planning and research
16 doing policy analysis and formulation on various
17 topics in energy and the environment. So
18 that's kind of where I'm coming from. That works,
19 that's a relief. I hate to be trapped back here,
20 you know. What a relief.

21 So I'm going to talk about promoting
22 public agency purchases of renewable power. What
23 are the roles of government. And I'm going to
24 look at why would you consider such a thing. How
25 would you bring it about. And then if you're

1 successful -- I've got some results from some
2 studies that happened last year or so that should
3 be interesting.

4 Okay, purposes, the why part. This
5 first one, reduced cost, I pulled that off a
6 solicitation that came out of General Services
7 briefly, so I felt I had to put that up there.
8 Frankly, I will discount this one right off the
9 bat, because I don't think reduced cost is one of
10 the main purposes.

11 We want to reduce cost in government --
12 we probably have other ways that would be more
13 effective in doing that other than chasing
14 emerging technologies. So, with that said,
15 reducing demand I think is an extremely viable
16 purpose, as well as increasing security and
17 liability.

18 This is a distributed generation
19 benefit. Having a source of generation onsite.
20 Particularly exciting to security interests within
21 the state, computer systems, people who need
22 premium power.

23 Expanding employment of emerging
24 technology. Well, clearly, I think that's a
25 public purpose that government can step up to

1 helping out.

2 Providing mechanisms for performing the
3 operation that venture capitalists like to refer
4 to as crossing the chasm, you know, getting from
5 RD&D and commercial development. I think the
6 government can serve a vital role in dragging
7 technologies across the chasm.

8 Altering the marketplace. Very
9 definitely. By making some of the early purchases
10 as technologies are approaching the chasm or
11 stepping into the void, government can play a key
12 role there.

13 Leading by example. This is a phrase
14 that the governor's used on a number of occasions.
15 I think it's perfectly apropos here.

16 Reflecting the values of its
17 constituencies. And here, in the context of
18 renewable energy, I think of concepts like
19 environmental externalities.

20 And somebody already mentioned
21 attributes such as security, liability, energy
22 independence, etc. Attributes that don't find
23 their way into the project budget. So it's a
24 plethora of issues that are value-driven.

25 Improved credibility. I think the

1 government serves a great role by using these
2 technologies. It says to the public at large yes,
3 these are very credible things. And gosh, if the
4 government is using it, it must be good.

5 So as much as people complain about
6 government, we do carry a lot of credibility when
7 we finally do something. The due process we go
8 through in public works, by the time we get done,
9 most everybody agrees it was a good thing.

10 Hedging risk. This can refer to supply
11 risks as we already mentioned, but also price
12 volatility risks. There are many cases where
13 public agency folks, in their budgeting exercises,
14 like to bring a budget in on time.

15 They're not so much worried about it
16 being high or low or saving money. It's an
17 important issue in the public sector that a lot of
18 folks really don't understand that people who are
19 running facilities -- facilities managers -- in
20 the public sector don't get a lot of accolades if
21 they bring in the energy bill under budget at the
22 end of the year.

23 But they'll sure get beat up if it comes
24 in over. And if the costs are volatile, that's
25 just a nightmare to them. They have a built-in

1 incentive to bring it in on budget.

2 So what are some of the potential roles
3 government can serve? Well, finance. There are
4 plenty of sources of financing available today.
5 The Power Authority is the big kid on the block,
6 they have \$5 billion of revenue bond authority.

7 But there's others as well. My own
8 department, General Services, they've got \$250
9 million. The California Alternative Energy and
10 Advanced Transportation Finance Authority, or
11 CAEATFA to its friends, has \$350 million in
12 revenue bonds available.

13 And there's some other things around,
14 like SIDFAC has industrial development bonds. The
15 Power Authority can also issue industrial
16 development bonds. There's a number of financing
17 mechanisms around that are available for
18 renewables.

19 Aggregators. This can be both as a
20 seller, which the Power Authority is working on,
21 or as a purchaser, which we had to do last year.

22 Developer. Kind of what I did for a lot
23 of years. Go out and develop projects. Who's
24 going to be the driving force behind getting these
25 projects done. You can't depend on people running

1 the facilities to do that.

2 Yes, there will be vanguards out there,
3 but by and large you have to kind of look at the
4 middle of the curve. And what are those people
5 doing? Well, they're running buildings. They're
6 responding to the complaints of the tenants.

7 That's their job. It's not your mission.
8 Their mission is to keep the tenants happy. And
9 so someone has to take that developer role. And
10 that is something that government can definitely
11 do.

12 Procurer. In the sense of mass
13 procurement. Hopefully, by aggregating demand for
14 products and services you can get volume discounts
15 on things and have a beneficial effect on pricing,
16 therefore helping the deployment of technologies.

17 Consumer protection. That's, I think,
18 pretty obvious. That's a government role almost
19 exclusively. Although there are private
20 organizations like, say, Better Business Bureau
21 and Chambers of Commerce that serve a valuable
22 purpose here as well.

23 Tax preferences. Certainly something
24 that government at all levels has hit pretty hard
25 in this area. Regulatory treatment, a lot of

1 people have talked about.

2 Research and development. That's
3 another important role of the government is to
4 keep development flowing into R&D. They also
5 serve as a user, providing the host sites. We
6 like to be guinea pigs for interesting, exciting
7 technologies that come on.

8 We offer good test sites. And an
9 important feature here is that the information
10 that is developed in those kinds of settings is
11 public information.

12 If you try and do an experiment with an
13 emergent technology at a private facility often
14 you end up with a lot of proprietary information
15 that may be helpful.

16 We have to be very careful about how we
17 use government money that way. We want the
18 results to be generally available, so government
19 sites are very good.

20 Plus, often these end up being
21 universities, where you have all this brainpower
22 around, and all this parallel research going on
23 that is enhanced by having the project onsite.

24 Information dissemination. This is not
25 just a credibility enhancing function, but getting

1 the word out about technologies that need to be
2 encouraged. It just makes technologies more
3 accessible to the public generally if they can go
4 to a website and find information.

5 I think one of the best examples there
6 is, the local government commission has a website
7 they call SPIRE, and if you haven't seen this you
8 ought to check it out.

9 It's an excellent example of how
10 information dissemination makes technologies more
11 accessible to the customers. Because their
12 customers are cities and counties, so it's
13 oriented toward a municipal customer.

14 So then, what are some of the mechanisms
15 available to bring about deployment of renewable
16 technologies. Capital outlay project -- that's
17 kind of the obvious one. That's -- well, the SB5X
18 approach. General Services got \$40 million to go
19 out and just build energy projects -- energy
20 efficiency and renewables.

21 For example, a 450 kilowatt PV system on
22 the top of the Franchise Tax Board, just a couple
23 miles down Highway 50 from here. That's a lot of
24 heavy lifting, to put out budget dollars to pay
25 for technologies that are marginally cost-

1 effective, as a way of looking at that issue. But
2 it certainly is on the top of the list there.

3 Tax exempt-financing is what I listed
4 off those other sources before. The revenue
5 bonds, that's tax-exempt revenue bonds. So those
6 bonds are sold at the marketplace. The holders of
7 those bonds don't pay taxes on the returns.

8 Therefore they get a lower rate of
9 interest. And then government raises money with
10 lower interest rates. It's a good deal. It takes
11 a couple of percentage points out of the cost of
12 the project. But it has to be for a public
13 purpose. So we need a public agency to build the
14 public up.

15 Bulk procurement. I touched on a bit
16 ago. And I will come back to bulk procurement.
17 I'll talk about some work that went on at the
18 Power Authority last year, as we did some bulk
19 procurement, or took a shot at it anyway.

20 Other financing. I will just throw lots
21 of things into that bucket -- rebates, third party
22 financing -- just about anything else you might
23 think of.

24 And the zero profit note there is the
25 idea that, let's say in a third party finance

1 situation, a project may be an easier sell to a
2 public agency because at the end of the day we
3 don't really have to turn a profit on them.

4 If our real purpose is to develop an
5 emerging technology, we'd be happy with a break-
6 even proposition as long as there's no prospect of
7 us going over the edge. That's not good, that's
8 never good, heads will roll.

9 But as long as we can kind of hold the
10 line on that we will tolerate zero profit
11 scenarios, which makes public agencies a tool that
12 adds a couple points to the project value.

13 Risk management. Again, this is about
14 supply and cost risk, but just taking a
15 perspective of risk management, a facility manager
16 may find him or herself in a position of saying
17 okay to a project that actually costs more than
18 the otherwise applicable rate because it provides
19 a premium power source. Again, this is the
20 distributed generation benefit, primarily.

21 So this is a chart, let me show you real
22 quickly what's going on here. This was some work
23 at the Power Authority last year, when they went
24 out to bid for three different technologies --
25 fuel cells, photovoltaics, and CHP -- and these

1 are some of the results.

2 This happened to be a fuel cell
3 company -- I know I've been talking about
4 renewables and this is a fuel cell and I do know
5 the difference, we can argue about that later.

6 This particular technology illustrates the
7 point I want to make very well, and then I'll
8 apply that same point to what we got on the solar
9 bids. So this was the pricing that they gave us
10 by each of the years.

11 And so you can see, up here in the first
12 year, if you just went to buy this product you'd
13 be in trouble, that's \$12,000 per KW. So you'd
14 have to have some serious, compelling reason why
15 you wanted to spend that much when you can
16 probably go out in the marketplace today and get,
17 you know, a gas turbine for somewhere down around
18 where -- got the light -- right here.

19 Now these are more efficient than a gas
20 turbine or any kind of precipitating engine thing.
21 So let's say the break point is about \$2,000 per
22 KW, the point at which this stuff would survive on
23 its own in the marketplace.

24 So everything below this line is kind of
25 cost-effective on its own. That kind of leaves us

1 with this area within this triangular shape here
2 that is early production of these units that needs
3 to be paid for in some way.

4 If that can be accomplished then we turn
5 loose on the world, you know, 2,000 per KW fuel
6 cells that get about 55 percent efficiency, from
7 fuel to electricity. That's a pretty good deal.
8 And we will have accomplished a wonderful purpose
9 in developing this technology.

10 This whole area here only managed about
11 six megawatts. You know, that's a lot, but it
12 could be worse. And only cost about 18
13 million. Now if this was a large mass
14 procurement and we were buying more than just this
15 much production -- and by the way, you can't tell
16 from this chart, it doesn't tell you anything
17 about volume. The volume of units was much higher
18 out here than it was back here. This is just a
19 handful of units. Only the cost was high.

20 And so the total cost of that was only
21 18 million. An average price of around 3,000 KW.
22 And so if you buy enough units you get further out
23 here and you push down the average cost, and you
24 can more likely place these in those niche markets
25 where these come up. Through the vastness of

1 government.

2 Okay, so that's the concept of the mass
3 procurement. But a fuel in development, dilute it
4 over a larger purchase, and get the cost down for
5 everybody.

6 Now here's what happened in solar. This
7 chart's a little goofy on purpose. Actually,
8 these are all the solar bids as they came in.
9 These squares show what the average is. Some of
10 these actually went up with time. Go figure.

11 These folks were strongly encouraged to
12 show us forward pricing. But when we got -- so,
13 that's just to show you how goofy the stuff is in
14 reality. But if we look at just the bid that's
15 down here -- and by the way, this company is now
16 out of business, and so is the fuel cell company.
17 These are some of the reality challenges of trying
18 to do good in the world, too.

19 It still makes an interesting case
20 study. If I showed you this chart first it would
21 be hard to grasp the concept that I showed on the
22 fuel cell chart. But the idea's the same here.
23 At 2,000 KW, or as the solar guys like to say, \$2
24 a watt.

25 Let's just say, for the sake of

1 argument, that this technology becomes cost-
2 effective and flies off the shelf, and there's
3 nothing more we need to do to encourage it. So,
4 you can see, the slope here is not nearly as good.

5 This one flattened out, that was due to
6 the bidding process. They would have given us a
7 price down here. In fact, had we had the
8 opportunity, we could have hammered these guys
9 down to something more like starting here, and
10 brought it down there.

11 That was also an artifact of the bidding
12 process, it was too vague, and the information
13 given out didn't have sites.

14 This total cost is more like 72 million,
15 and it's 14 megawatts. So that's a little steeper
16 hill to climb in terms of the mass purpose
17 exercise. So there's a little work to go. The
18 good news is, and probably most of you are aware
19 that the Power Authority is working on another
20 version of this.

21 There's nothing that's been formally
22 announced yet, but it's been informally announced
23 a couple of times that I heard that we would now
24 expect to get prices starting here in the 375
25 range, and I have been told by manufacturers in

1 Japan that we can expect a price point that is out
2 about where my dot is here.

3 \$2 a watt in 2010. And that's an
4 exciting price point, if we can get to that. That
5 unleashes the stuff on the world.

6 So what happens. Now this is some work
7 that came from a study group that met at OPR,
8 mostly over last summer. And this particular
9 model here was largely put together by Gregg
10 Morris, who's in the audience, from the Green
11 Power Institute. And supported by the National
12 Renewable Energy laboratory.

13 This looks at the different renewable
14 technologies, and what happens in various RPS
15 scenarios. This particular scenario here is kind
16 of a base case of 20 percent in 2017.

17 And so here we can see geothermal -- I'm
18 sorry, on the copies yellow didn't copy -- you can
19 see geothermal and wind rise up the fastest.
20 They're well-established, lots of resource, they
21 get moving real quickly.

22 And all these other technologies, the
23 biomass and etc -- and these two right here I
24 actually want to bring your attention to. This is
25 actually an exponential growth curve.

1 It starts at such a low, low, rate for
2 both solar/thermal and PV that students of
3 mathematics would realize that, yes, that's
4 exponential growth. Let it go for a few years and
5 see what happens. It truncates upwards.

6 So then we asked what happens if you
7 pulled out all the stops. Because what the model
8 does, and I think this is additive to the work
9 that is going on at the Energy Commission and I
10 hope you all will embrace this and incorporate it.

11 This looks at how would these businesses
12 grow if the environment in which they live were
13 altered in some way. We can model different
14 scenarios of what happens to these businesses. We
15 do all these things to incentivise and de-
16 incentivise certain behaviors.

17 So then what happens to these
18 industries. And that's what we're plotting over
19 the years, in terms of megawatts. So then what
20 happens if there are no constraints? We don't
21 have business growth problems, we don't have
22 anything except limitations of the resource
23 itself.

24 Well, then this in on about the same
25 scale. Before we were on this zone with

1 geothermal. The interesting things are up here,
2 because geothermal has crested. It has hit its
3 resource limitation up here. And wind is about to
4 do the same. Not that we run out of wind, but
5 there's real estate accessibility issues that are
6 kicking in in a big way.

7 And then the thought I want to leave you
8 with here is to look at the solar, what happens
9 here. It still concaves upwards and growing
10 exponentially, but out of all of these resources,
11 This scenario gets us to 32 percent by 2017.

12 This is what could take us up to the 100
13 percent scenario. And that's off the chart data-
14 wise. A little factoid I will leave you with is,
15 if one-half of one percent of the surface area of
16 California were covered in PV, not especially
17 efficient PV, just ordinary stuff, it would equal
18 the heat demand of the state. One-half of one
19 percent.

20 Now, to be fair, that's a square 30
21 miles on the side. And that's a hundred billion
22 dollar undertaking. But, you know, just to kind
23 of put that in perspective. And with that, I'll
24 close.

25 MR. DUVAIR: Thank you very

1 much, Doug. Well, one of the things that I've
2 seen through the first three speakers is that
3 renewable technology is going to be the key to
4 progress in all of the areas for biomass and PV and
5 with the agriculture use.

6 And so we've got George Simons from the
7 Energy Commission is going to speak to us about
8 renewable technologies.

9 MR. SIMONS: We've got a fairly large
10 portfolio of renewable technologies, so this is a
11 scattering -- wait, wrong presentation. Let's go
12 back. Okay, that looks a little bit better.

13 So I wanted to focus primarily on
14 renewable technologies that would impact global
15 climate change. And really, when you start
16 talking about renewables and global climate
17 change, renewables can impact global climate
18 change in two ways.

19 They can either impact them directly by
20 reducing methane or impacting carbon dioxide. Or
21 they can impact them indirectly by displacing a
22 fossil fuel, which would be a contributor to
23 carbon dioxide.

24 So if you begin looking at renewable
25 technologies, the biggest impact on methane

1 emissions is really landfills in California and
2 livestock manure.

3 It turns out that enteric fermentation,
4 or gas from cows, is a fairly large contributor
5 also. But we don't really know how to get a
6 handle on that one right now.

7 But, again, it's fairly large sources.
8 There's over 300 active landfills in California,
9 there's over 2,100 dairies. So it quickly becomes
10 a question of size. And literally, inversely, a
11 size question.

12 These are not going to be large power
13 plants. There's going to be a lot of small power
14 plants. There might be some centralized power
15 plants. But because of the nature of the resource
16 they tend to be more distributive.

17 Carbon dioxide emissions. It turns out
18 that forestry, actually, is a big sink for carbon
19 dioxide. So what we want to do is maintain or
20 increase the potential to have a sink. And you do
21 that by reducing wildfires and open field burning
22 emissions.

23 And then I'm going to finally talk about
24 what types of renewable technology developments
25 that would act as an indirect reduction of fossil

1 fuel combustion. And so if you're looking at
2 landfill gas the biggest issues facing further
3 development of landfill gas energy is primarily
4 one of cost.

5 It takes on the average of about 50
6 years to get gas out of a landfill. Even though
7 it's not a highly capital-intensive prospect,
8 nonetheless because of the large amount of time in
9 recovering the gas it becomes a cost prohibitive
10 venture for most entities.

11 So we're really looking at some research
12 that has been developed by Yolo County. We funded
13 that research from early on, on accelerated
14 decomposition, or what's termed bioreactors. And
15 what that does is essentially reduce the timeframe
16 of getting the organic matter turned into methane
17 by about a third.

18 So, instead of a 50 year lifetime to
19 recover gas you're down to essentially ten or 15
20 years. So you accelerate the methane capture, you
21 increase your cost-effectiveness. But also
22 because in fact you're converting at a higher rate
23 you compress the amount of space in the landfill.

24 Which is a big benefit to
25 municipalities, because siting an additional

1 landfills is a real problem anywhere you're
2 located. Yolo developed a control cell under an
3 earlier R&D program, and we built off of that,
4 under PIER renewables.

5 And we're now going to the next step.
6 We're looking at how can you take what was a very
7 much an R&D effort and mainstream it. So we're
8 working with CH2 and Commonwealth Energy looking
9 at how do you take this very sophisticated
10 bioreactor developed at Yolo and put it into what
11 would be a commercial operating entity.

12 So we're in the process of identifying a
13 landfill. We're looking very closely at San
14 Bernardino. And that would both extend the
15 landfill in terms of making it a commercial size
16 facility, as well as simplifying its operation.
17 So it's something that can be adopted widely
18 throughout the state.

19 A lot of people have been talking about
20 digester-type facilities. Again, these tend to be
21 high capital cost, on the order of \$4,000 a
22 kilowatt. Also, because these are distributive
23 generation type systems, by 2007 they have to meet
24 the NOX emission requirements of the California
25 Air Resources Board.

1 That's been a problem, because a lot of
2 these types of facilities use reciprocating
3 engines, which tend to have higher NOX emissions.
4 So, in terms of the high capital costs we've done
5 a fair amount of work in digesters.

6 We run the SP5X program, the dairy power
7 production program, which is commercial
8 technologies on dairies. And then we've released
9 a targeted solicitation to really look at how do
10 we improve conversion efficiencies and reduce
11 costs.

12 One of the projects we're looking at is
13 Valley Fig, which is going to be investigating
14 above-ground types of reactors that would have a
15 much higher conversion, and consequently, through
16 simplified design approach a lower capital cost.

17 Flex Energy is a company that worked
18 closely with Capstone, so it's a microturbine.
19 But it's a microturbine that's been outfitted with
20 a catalyst so that in fact it can burn very low
21 BTU gases.

22 That's really important from both a
23 digester and a landfill gas perspective because on
24 a retrofit basis you've got landfills that haven't
25 completed conversion of organic matter to methane,

1 so the methane that is being released is actually
2 low concentration.

3 Similarly, with digesters you want to
4 make certain that you have the capability to take
5 into account any fluctuations in gas quality and
6 seasonality of the gas. And you want to achieve
7 very low NOX emission rates.

8 And Flex Energy does both of those.
9 We've seen it operate on a prototype where it
10 achieved less than one part per million on NOX
11 emissions consistently over a pretty wide
12 operating range.

13 We also are looking at how to reduce
14 wildfires in California and reduce open field
15 burning emissions. And we've been working with a
16 very innovative firm, Community Power Corporation.

17 One of the biggest challenges in solid
18 fuel combustion or gasification of solid biomass
19 is that these things always look like the latest
20 mousetrap. They're not something that you would
21 want to put on a facility unless you were going to
22 spend a lot of engineering time on it.

23 CPC has come up with a design that in
24 fact looks very much like a Capstone-type
25 approach. It has good load following, and again,

1 since we're talking about urban interface areas
2 that are probably out at the end of the
3 distribution line, these are going to have to have
4 the capability to replace retail, or to do some
5 load following.

6 And so this is the CPC unit. It's been
7 tested by the Hoopa Valley Tribe up in northern
8 California. Worked very successfully. We're now
9 working with Department of Forestry for additional
10 applications where it would be a joint project.

11 One of the biggest issues facing biomass
12 power plants in California, somebody mentioned,
13 the high cost of electricity generation. Well,
14 one of the things you can do with solid fuel
15 biomass power plants is try to increase the
16 peaking capability.

17 Because again, peaking generation
18 provides a lot of value to the grid. It's also
19 something you can get more money for. TIAX, which
20 was a spinoff of the Gas Technology Institute,
21 developed a co-firing system which uses natural
22 gas in combination with the solid fuel combustor,
23 provides lower NOX emission rates, and provides
24 very quick rampup at a very small incremental
25 price.

1 It's been tested both at Fairhaven and
2 at Burney Mountain Power, worked very well, and we
3 would expect this technology to work out into the
4 mainstream biomass power plants in the state
5 relatively quickly.

6 I want to switch gears now and go away
7 from direct methane and carbon dioxide, and talk
8 about indirect. Because we've got a lot of
9 research work going on in the ares of wind and
10 solar.

11 And so if you look at wind in California
12 right now, there's 1,700 megawatts of capacity.
13 We know there's a huge wind potential in
14 California. Some of the mapping that we've done,
15 we're actually very surprised at just how huge the
16 potential may be.

17 Back in the '80's some of the early
18 mapping indicated maybe 30,000 megawatts of
19 potential. We think that number is significantly
20 much higher. Especially if you go up into these
21 higher lines that we're looking at.

22 But the big issues with wind are the
23 capacity value. And in fact we think there's a
24 high capacity value for wind that's largely not
25 recognized. Wind, in certain instances, will have

1 a high peaking value.

2 Reliability of wind. People are
3 concerned about the intermittent nature of wind.
4 I haven't talked about in this slide, I will
5 towards the end though.

6 So we have two hardware development
7 activities that we're involved in with wind. One
8 is with the Wind Turbine Company. It's developed
9 a very innovative two-bladed downwind wind turbine
10 that -- the cost projection is that it would come
11 in around three cents kilowatt hour. This was one
12 of the advanced technologies that the Energy
13 Commission worked with NREL and DOE on.

14 We had a very successful test at
15 (inaudible). We did not have a very successful
16 test at Fairmont Reservoir. We had a catastrophic
17 failure. We think, at this point in time, that
18 that catastrophic failure was not a design
19 failure, but actually was a maintenance failure.

20 So we still think there's a high
21 opportunity to move forward with this technology,
22 but we're in a wait and see position right now.

23 Another firm that we're working with is
24 Clipper Wind. And they're looking at a way to use
25 -- up in the far right hand corner is a device

1 that would replace a standard gear box generator
2 for a wind turbine.

3 Gear box problems with wind turbines are
4 huge in California, they're actually huge across
5 the country. It causes downage problems that tend
6 to be very expensive, because it's very difficult
7 to go up 100 feet, 200 feet in the air, grab the
8 gear box, and bring it back down.

9 So you want to have high reliability.
10 This company, Clipper Wind, has developed this
11 distributive generator system that provides them
12 with a wide operating range as well as a much
13 higher degree of reliability. And that's
14 currently under prototype testing.

15 I mentioned that there was something
16 that I didn't show on here, and it deals with the
17 intermittent nature of wind. We're working very
18 closely with EPRI, Cal ISO, the California Wind
19 Energy Collaborative, on wind forecasting and
20 valuing wind, and how to integrate or evaluate the
21 cost of integrating wind into California.

22 Those are really important if you want
23 to see future development of wind. It can provide
24 high benefit to the grid.

25 In the case of solar technologies, I'm

1 not talking about concentrating solar here. We do
2 have some concentrating solar activities underway,
3 with Solargenix as well as with some of the
4 Stirling people.

5 But I did want to talk about some of the
6 work going on with PV. Doug mentioned that -- he
7 was hinting that -- PV has a very large potential
8 in California. One of the biggest hurdles to PV
9 development in California is the fact that putting
10 a system up on a house you have to have the right
11 configuration.

12 To date there's been very limited ways
13 to put those on tops of commercial buildings or
14 residential buildings. Home developers don't like
15 a high profile. They don't like roof
16 penetrations. And so we've worked very closely
17 with SMUD and some other folks on developing
18 different mounting techniques.

19 These are very successful approaches
20 right now. We've had PowerLight Corporation,
21 which started off as a very small firm, came into
22 the Energy Commission, is now one of the fastest
23 growing PV firms in the world.

24 We've worked closely with Uni-Solar.
25 This is a standing scene roof. It's very easy to

1 apply. It comes in a roll that you literally roll
2 out. Significantly reduces the amount of time to
3 put PV on top of a roof.

4 Geothermal technologies. The single
5 biggest barrier to geothermal development in the
6 state, in California, is the high cost of
7 exploration.

8 And some of the work that we have done
9 on the PIER renewables side is with a company
10 called EMI, who has developed a three-dimensional
11 imaging tool that reduces the cost of figuring out
12 where the geothermal resource is.

13 They've successfully tested this at
14 Dixie Valley. We think that if this successfully
15 goes into the next stage it could be significant
16 enough to reduce geothermal exploration costs on
17 the order of around 20, 30 percent.

18 And that's it, at least for the
19 technologies I could talk about today.

20 MR. TUTT: Thank you, George. And Doug
21 and Doug and Matt. Pierre. Interesting
22 presentations here for the last item on the
23 agenda, relating to really going beyond the RPS in
24 reducing greenhouse gases in California with
25 renewable energy.

1 We've listed some questions in the
2 workshop notice and they relate very well to the
3 presentations you've seen today. Reducing fuel
4 costs at biomass power plants by looking at
5 distributive generation and agriculture use of
6 renewable energy. And also increasing the use of
7 renewable energy by state and local governments.

8 Rather than read off these questions I'm
9 just inviting people to come up, and if they have
10 anything to say or comment or any questions about
11 what we can do, please come to the microphone and
12 provide your input. Gregg?

13 MR. MORRIS: Thanks. Gregg Morris of
14 the Green Power Institute. And I just want to
15 address fairly quickly the issue of this
16 accelerated RPS, where we're looking at a
17 potential locating the 20 percent renewables by
18 2010.

19 And in context with Doug's presentation
20 which showed what we constructed as what we called
21 our maximum renewable penetration scenario. And
22 what Doug showed was something like 32 percent by
23 2017.

24 It just so happened that that also hit
25 21 or 22 percent, on its way to that 32 percent in

1 2017. And so if our assumptions were correct, and
2 our analysis was correct, we did put together a
3 scenario that would hit 20 percent by 2010. And
4 it is what we consider to be the maximum rate of
5 penetration for the renewables, looking at each
6 renewable category.

7 And this was based on a logistic
8 penetration study, which means that the logistic
9 curve is sort of your typical S-shaped curve where
10 you go up in an exponential growth pattern until
11 you start hitting limits to market penetration,
12 and it then tapers off until you hit the maximum
13 market penetration that can be had.

14 And so this is a sort of study that is
15 done outside of the constraints of worrying about
16 little things like transmission constraints. It's
17 really based on ultimate potential for the various
18 renewables, and just basic growth rates of how
19 things happen in the world.

20 Logistic curves have been successfully
21 applied in a variety of areas, from population
22 studies to penetration of new technologies into
23 existing markets and so on. So, for what it's
24 worth, 20 percent by 2010 is possible.

25 It's pushing every renewable to its

1 limit. But it's an interesting scenario.

2 CHAIRMAN BOYD: Gregg, was it predicated
3 on today's technology, or were you presuming
4 technological advances?

5 MR. MORRIS: Well again, the nice thing
6 about a logistic market study is that you don't
7 worry about that. You don't try and call which
8 technologies within a resource category you're
9 getting. You're letting the market take care of
10 itself.

11 And what you're trying to do is see how
12 fast you can push the resource itself, assuming
13 that technologies do develop. And the develop as
14 a function of the market penetration. The more
15 units you build, the more learning you do, and
16 therefore the better your technology becomes.

17 CHAIRMAN BOYD: Were you focused on an
18 instate resource?

19 MR. MORRIS: Yes, oh yes, California
20 only, yes.

21 CHAIRMAN BOYD: So you didn't presume
22 any imports from elsewhere?

23 MR. MORRIS: That's correct. Those were
24 all in the state of California.

25 CHAIRMAN KEESE: Can I follow up on

1 asking Doug a question? Doug Grandy. Recognizing
2 the advancements we were successful in getting in
3 DGS looking at energy efficiency activities and
4 other options, and your last two years in this new
5 role, were we to recommend major state activities
6 in requiring renewables, do you think that would
7 be met with positive reaction at General Services
8 or other leadership?

9 MR. GRANDY: Well, I'm sure that General
10 Services stands ready to respond to a request.
11 These are interesting times in state government,
12 as I'm sure you know. And the toll has been taken
13 in General Services as well, and I could give you
14 a very definitive answer once there's a budget,
15 and we see what the affect is at it tumbles down.

16 Depending on how that comes out, there
17 could be massive carnage in the department. And
18 one of the features of my group that I left behind
19 is that it's not a mandated function of
20 government.

21 It was entrepreneurial, and operated as
22 a fee-for-service self-supporting agency. And in
23 plain English translation, it's expendable in
24 today's environment.

25 So, barring any more of those kinds of

1 calamities, I'm sure the department would be more
2 than happy -- and I should mention that the Power
3 Authority is certainly positioning itself, as you
4 well know, to pick up a lot of that development
5 drive that I spoke of. And hopefully, you know,
6 we all wish them the best of success in their
7 endeavors.

8 CHAIRMAN KEESE: Well, clearly we have
9 policy drivers, as I mentioned earlier. We have
10 the governor first just setting forth a plan to
11 get to the 20 percent. And then we have the
12 legislature adopting it and setting forth the
13 plan.

14 And now we have a collaborative between
15 the PUC and Energy Commission to use the renewable
16 funds and their activities to get there. Another
17 road is to have the state take -- I'll just pick
18 on one -- and that's directly purchase renewables
19 or install photovoltaics on more buildings, or
20 activities like that.

21 And I gather the fact that you've been
22 looking at it in an official capacity means that
23 that may be a fertile field. We're not heading
24 into a brick wall if we decide to recommend
25 something in that area.

1 MR. GRANDY: On the path of directly
2 purchasing renewables, I believe the bottleneck is
3 not General Services. Once the project gets
4 there, it'll get done as quickly as it can get
5 done.

6 The bottleneck is clearly upstream in
7 getting projects like that funded amidst all the
8 other competition for hard dollars.

9 CHAIRMAN KEESE: Thank you.

10 MS. TURNBULL: Jane Turnbull again. And
11 I'm not sure whether I'm speaking for the League
12 of Women Voters or my alter ego, so I'm -- because
13 the presentations really brought me back to
14 previous lives that I have been in and have been
15 very involved in.

16 Biomass has been the area that I have
17 worked in most significantly over the last 10 to
18 15 years. And I appreciated both the Forestry
19 presentation and also Matt Summers agricultural
20 presentation.

21 And I think one of the first points I'd
22 like to make is it's important for people to
23 understand that wood waste is different than
24 agricultural waste, and people tend to lump
25 biomass into one category.

1 And each substrate or feedstock is
2 unique and the way that it needs to be treated is
3 unique, and the technologies that are appropriate
4 are unique.

5 Secondly, in terms of how they are going
6 to fit into the greenhouse gas mitigation scheme
7 is also going to be very specific. Certainly,
8 reduction in wildfires is an important concern.
9 But when you're dealing with what's going to
10 landfills right now, such as food processing waste
11 and green waste, you have a whole other life cycle
12 assessment to look at there.

13 And the opportunities to mitigate the
14 emissions from fertilizer production are not
15 something that are negligible. Actually, this
16 could be very significant. And the digestate from
17 digester materials is very high in nitrogen, and
18 is a very suitable soil amendment.

19 Actually it is almost perhaps a direct
20 substitute for fertilizer. And considering the
21 amount of natural gas that goes into the
22 production of fertilizer, the opportunity for a
23 greenhouse gas emission there is very notable.

24 I also would like to make a point that,
25 having the PIER program in the CEC, under the

1 auspices of the CEC, is a very real advantage
2 toward perhaps realizing the 2010 accelerated
3 goals of renewables. The concerns about small
4 modular biomass have been around for about 15
5 years.

6 Bob Williams, who was a McArthur Fellow
7 and a very brilliant professor at Princeton, came
8 out with the division of the integrated
9 gasification combined cycle biomass system. And
10 he sold this to the world.

11 Sweden bought it, and Great Britain
12 bought it, and our Department of Energy bought it.
13 And they have put literally hundreds of millions
14 of dollars into integrative gasification combined
15 cycle facilities. And I don't believe any of them
16 are operating at this point in time.

17 It's really been tragic. And the point
18 that I'm trying to make is that it didn't have to
19 be this way if people looked at this in a phase
20 kind of process, and looked at what the problems
21 were, and addressed the research components of the
22 problems along the way, which would have been far
23 less expensive.

24 And the hundreds of millions of dollars
25 that went into these projects might have well been

1 saved. So I think there are some concerns. The
2 Community Power Corporation project is probably a
3 very good one because they did it at Hoopa first,
4 where they didn't try to generate power. They
5 were simply doing a thermal system.

6 And that's probably a better way to go
7 for any one of these systems and do it in a phased
8 kind of mode, and then add the more sophisticated
9 challenges incrementally.

10 The World Bank did not do that. They
11 also put hundreds of millions of dollars out into
12 gasification technologies that are around the
13 world in developing countries rusting all over the
14 place, because they were far too sophisticated for
15 what the technology was at that point in time.

16 There are a lot of companies out there that
17 have good PR, and they have good concepts, but
18 they haven't validated those concepts.

19 Several years ago, when I was working at
20 EPRI, we worked with Bechtel and looked at all
21 these small modular biomass systems that were on
22 the market, and I think we looked at 110 of them.

23 Out of 110 we felt that three were
24 perhaps really viable. The rest were all on the
25 Internet and they had good websites and lots of

1 promises.

2 But it really is, you know, a cautionary
3 -- I'd like to make it a cautionary concern that
4 what we read in the newspaper is not always what
5 is so.

6 Again, I think these things can be done
7 in a phased mode, and the opportunity to utilize
8 the research program as part of the whole is
9 something I think is worth incorporating. And I
10 wish you well on the 2010 date.

11 CHAIRMAN BOYD: Thank you. I --
12 personally, that's very sage advice. And I wish
13 some people had followed it when they designed the
14 electrical system here a few years back. But
15 anyway, that's a good point. Thank you, Jane.

16 MR. ROMANOWITZ: Hal Romanowitz again.
17 I know you're obviously struggling with ways to
18 try and break the mold and create a more rapid
19 penetration rate, and one suggestion of something
20 you could look at that would be a recommendation
21 that I think you could do and could have a moving
22 effect would be the ultraclean or renewable
23 fulfillment of direct access and departing load
24 issues.

25 That by removing all of the restrictions

1 and cost impacts that have been placed on
2 departing load in particular and direct access as
3 a second step.

4 By removing those and allowing renewable
5 energy, or ultraclean energy, to fulfill and go
6 into those markets without the substantial
7 penalties that are put on them now because of the
8 Department of Water Resource charges, that would
9 be a way to essentially start breaking -- give
10 that market a way to break open.

11 And if you did it on the basis of 100
12 percent renewable, 100 percent clean, then you're
13 setting a standard that really allows the
14 renewables to fulfill higher penetration levels as
15 time goes on. And I think you'd find a mold-
16 breaker using that approach.

17 CHAIRMAN BOYD: I take it you don't
18 think the CPUC decision on departing load went far
19 enough?

20 MR. ROMANOWITZ: It helps materially.
21 And I am looking and working at it now. It
22 appears that it does help some situations but it
23 doesn't go far enough to really do as much as
24 could and probably should be done to break the
25 market open, right.

1 CHAIRMAN BOYD: And what are the
2 principle areas that you find deficient there? Is
3 it the size limit?

4 MR. ROMANOWITZ: Well, yes, the size
5 limit -- and I don't believe there's a size limit
6 on it now. I believe there's at least one option
7 where there's not a size limit, but there still
8 are some relatively significant back charges to
9 pick up.

10 And secondly, if somebody was a direct
11 access customer, and then shifts to departing
12 load, he's got a tremendous get, and it makes it
13 just not feasible. And that type of a customer is
14 the one that is most receptive to taking the risk
15 of doing that sort of thing.

16 And it's probably not that big a thing
17 to the overall effect of paying off the back
18 charges, but it sure could be a breaker to open up
19 a market where you have a number of the other
20 potential purchasers with the utilities reluctant
21 to move quickly.

22 When you break the market open to let
23 somebody who really wants to do it do it, I think
24 it could shift the whole market open.

25 CHAIRMAN BOYD: The direct access area

1 is one that the legislature has reserved for
2 itself in terms of determining when that is
3 reopened. And the PUC decision was in fact
4 confined to departing load.

5 MR. ROMANOWITZ: Right.

6 CHAIRMAN BOYD: I understand what your
7 point is better.

8 MR. ROMANOWITZ: Okay.

9 CHAIRMAN KEESE: We fully understand.
10 We have a yoke, and it's not just around
11 developing renewables, it's a yoke around
12 everybody's neck that is going to influence the
13 system for the next ten years at least. So, --

14 MR. ROMANOWITZ: Yes, I realize -- and
15 again, when you look at it, is that yoke something
16 that can be twisted a bit enough to make it break.
17 I think it's an area that has more potential and
18 probably can be worked if the rules are carefully
19 tailored.

20 CHAIRMAN KEESE: Correct. Depending on
21 which half -- one half of one percent of the
22 market, or one percent of the market we care to
23 benefit.

24 And it could be, and some people would
25 argue that that should be agriculture, and some

1 people would argue that it should be the renewable
2 industry, and some people would advocate that it
3 should go to the industrial segment so that we
4 don't lose it in California, and --.

5 MR. ROMANOWITZ: You might find if you
6 do it that you get some breaks. But the point
7 being that the renewables were not a part of the
8 mix that could compete for the problem. they
9 really could not compete for the DWR
10 overpurchases.

11 So that, in a way it's very unfair to
12 penalize renewables for ten years. And I think
13 that there are equities where if you look at it
14 and manage it reasonably you might be able to
15 break it open.

16 CHAIRMAN BOYD: I'm afraid many of us
17 now recognize the chilling effect that that yoke
18 has had on a lot of the possibilities, but it's
19 something that we all need to continue to talk
20 about.

21 The trouble is to move it is to move it
22 to some other accounting column, and put the debt
23 someplace else. But it's probably something
24 that's worth talking about in terms of what is
25 chilling and what the developmental possibilities

1 we're losing.

2 CHAIRMAN KEESE: Yes, and if you're
3 speaking of it in increments, I think the PUC
4 action was positive.

5 MR. ROMANOWITZ: Definitely. it was
6 certainly a positive step. and it says that there
7 is something that can be done. And the question
8 is is there a way to revisit it and --

9 CHAIRMAN KEESE: Next year we can
10 revisit it.

11 MR. ROMANOWITZ: Okay.

12 MR. TUTT: Tom?

13 MR. TANTON: Thank you. One very brief
14 comment that I hope the Commission does not lose
15 sight of. It affects the accelerated scenario
16 probably more than the regular scenario, whatever
17 that is.

18 But what I hope you don't lose sight of
19 is the need for support infrastructure. Trained
20 installers, people that understand how to operate
21 these things.

22 I know the Commission has some programs
23 in that area in conjunction with other folks. But
24 that is crucial. That we don't get a new surge of
25 renewables and then falls flat on its face because

1 of the lack of support infrastructure.

2 MR. TUTT: Thank you. Any other
3 comment?

4 CHAIRMAN BOYD: I think you've hit the
5 end of the road.

6 MR. TUTT: I think so. I'd like to
7 thank everyone for coming in. I'd like to make
8 one slight announcement, and that is we included a
9 date for public written comment in this workshop
10 notice of June 20th, last Friday.

11 It was primarily because we need to get
12 this preliminary renewable resource assessment,
13 which was the topic of this morning, to the PUC by
14 July 1st. So there's very little time to
15 incorporate comments on that report.

16 On the Renewable Resource Development
17 Report, the PIES Report, and the global climate
18 change part of the Integrated Energy Policy Report
19 there is additional development work going on for
20 the next few months.

21 I'd like to suggest you'll have plenty
22 of opportunity to comment. But if you have
23 written comments that you would like to address to
24 the topics of this afternoon, if you could get
25 them to us by July 7th we probably can use them

1 for the Public Interest Energy Strategies Report
2 and moving forward on the Integrated Energy Policy
3 Report.

4 CHAIRMAN BOYD: Speaking for the three
5 of us, I hope, I would like to thank the audience
6 and the staff for a job well done today, and a
7 really interesting discussion. Thank you.

8 CHAIRMAN KEESE: Yes, and I -- as you
9 know, we're going to come up with our
10 recommendations to the governor to establish state
11 policy. If this is fed -- consider this as input
12 to you.

13 If you can come up with recommendations
14 you think we should make, fell free to do it over
15 the next couple of weeks. We will be recommending
16 a hundred policy issues, probably, to the
17 governor.

18 You'll get a crack at them too, because
19 we're going to put them out in public so you can
20 comment on what we come up with. But we sure can
21 use help in figuring out what those
22 recommendations should be. Thank you.

23 MR. TUTT: Thank you.

24 (Thereupon, at 3:38 p.m. the workshop was
25 adjourned.)

CERTIFICATE OF REPORTER

I, PETER PETTY, an Electronic Reporter,
do hereby certify that I am a disinterested person
herein; that I recorded the foregoing California
Energy Commission Workshop; that it was thereafter
transcribed into typewriting.

I further certify that I am not of
counsel or attorney for any of the parties to said
workshop, nor in any way interested in outcome of
said workshop.

IN WITNESS WHEREOF, I have hereunto set
my hand this 8th day of July, 2003.

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345
